Radon Information

This section lists any relevant radon information found for the target property.

Federal EPA Radon Zone for *SAN BERNARDINO* County: **2**

Zone 1: Counties with predicted average indoor radon screening levels greater than 4 pCi/L
Zone 2: Counties with predicted average indoor radon screening levels from 2 to 4 pCi/L
Zone 3: Counties with predicted average indoor radon screening levels less than 2 pCi/L

Federal Area Radon Information for *SAN BERNARDINO* County

No Measures/Homes:	17
Geometric Mean:	0.5
Arithmetic Mean:	0.7
Median:	0.7
Standard Deviation:	1
Maximum:	2.9
% >4 pCi/L:	0
% >20 pCi/L:	0
Notes on Data Table:	TABLE 1. Screening indoor radon data from the EPA/State Residential Radon Survey of California conducted during 1989-90. Data represent 2-7 day charcoal canister measurements from the lowest level of each home tested.

Appendix

Federal Sources

FEMA National Flood Hazard Layer — **FEMA FLOOD**

The National Flood Hazard Layer (NFHL) data incorporates Flood Insurance Rate Map (FIRM) databases published by the Federal Emergency Management Agency (FEMA), and any Letters Of Map Revision (LOMRs) that have been issued against those databases since their publication date. The FIRM Database is the digital, geospatial version of the flood hazard information shown on the published paper FIRMs. The FIRM Database depicts flood risk information and supporting data used to develop the risk data. The FIRM Database is derived from Flood Insurance Studies (FISs), previously published FIRMs, flood hazard analyses performed in support of the FISs and FIRMs, and new mapping data, where available.

Indoor Radon Data — **INDOOR RADON**

Indoor radon measurements tracked by the Environmental Protection Agency(EPA) and the State Residential Radon Survey.

Public Water Systems Violations and Enforcement Data — **PWSV**

List of drinking water violations and enforcement actions from the Safe Drinking Water Information System (SDWIS) made available by the Drinking Water Protection Division of the US EPA's Office of Groundwater and Drinking Water. Enforcement sensitive actions are not included in the data released by the EPA. Address information provided in SWDIS may correspond either with the physical location of the water system, or with a contact address.

Radon Zone Level — **RADON ZONE**

Areas showing the level of Radon Zones (level 1, 2 or 3) by county. This data is maintained by the Environmental Protection Agency (EPA).

Safe Drinking Water Information System (SDWIS) — **SDWIS**

The Safe Drinking Water Information System (SDWIS) contains information about public water systems as reported to US Environmental Protection Agency (EPA) by the states. Addresses may correspond with the location of the water system, or with a contact address.

Soil Survey Geographic database — **SSURGO**

The Soil Survey Geographic database (SSURGO) contains information about soil as collected by the National Cooperative Soil Survey at the Natural Resources Conservation Service (NRCS). Soil maps outline areas called map units. The map units are linked to soil properties in a database. Each map unit may contain one to three major components and some minor components.

U.S. Fish & Wildlife Service Wetland Data — **US WETLAND**

The U.S. Fish & Wildlife Service Wetland layer represents the approximate location and type of wetlands and deepwater habitats in the United States.

USGS Current Topo — **US TOPO**

US Topo topographic maps are produced by the National Geospatial Program of the U.S. Geological Survey (USGS). The project was launched in late 2009, and the term "US Topo" refers specifically to quadrangle topographic maps published in 2009 and later.

USGS Geology — **US GEOLOGY**

Seamless maps depicting geological information provided by the United States Geological Survey (USGS).

USGS National Water Information System — **FED USGS**

The U.S. Geological Survey (USGS)'s National Water Information System (NWIS) is the nation's principal repository of water resources data. This database includes comprehensive information of well-construction details, time-series data for gage height, streamflow, groundwater level, and precipitation and water use data.

State Sources

Oil and Gas Wells — **OGW**

A list of Oil and Gas well locations. This is provided by California's Department of Conservation Division of

Appendix

Oil, Gas and Geothermal Resources.

Public Water Supply Wells **PWSW**

List of community water supply wells in California. This data was made available by California Department of Water Resources, Division of Statewide Integrated Water Management, who indicates that the management of the data in an ongoing project, and some county data is not represented. Location information is provided using the Public Land Survey System (PLSS) and is subject to the accuracy limitations inherent to the PLSS system.

Water Wells **WATER WELLS**

A list of water wells maintained by the Department of Water Resources (DWR) Water Data Library.

Well Investigation Program Case List **WIP**

The Well Investigation Program (WIP) was developed by the State Water Resources Control Board (SWRCB) to locate, assess and remediate sources of solvent contamination impacting drinking water wells. This list contains WIP cases (active and historical) for the San Gabriel and San Fernando Valley area and was provided by the Los Angeles Regional Water Quality Control Board.

COLTON, CALIFORNIA

This is to confirm that the OFM Hazardous Materials Division (HMD) has searched its records for any file(s) pertaining to the subject property, as described in your request, and finds that no records exist for the above site description(s).

Records maintained by OFM-HMD date back to mid-1980's. Records searched include:

- facilities with hazardous waste generator permits, hazardous materials handler permits, underground storage tank permits, universal waste permits, tiered permits, EPCRA facilities, RMP facilities, Cal ARP facilities, and/or waste recycling generators, including inactive and/or out of business records, as well as non-permitted facility actions;
- logs of permits issued for the removal, installation, and/or modification of underground storage tanks;
- records and databases pertaining to illicit dumping, spill reports and release notifications, and complaints;
- incidents responded to by the hazardous materials emergency response team;
- and sites undergoing remediation for contaminated soil and/or groundwater.

Dear Mr. Hansen:

We have received your Public Records Act Request for records from the Department of Toxic Substances Control.

After a, thorough review of our files we have found that some records exist at this office pertaining to the sites/facilities reference. I have attached hard copies of the complete site documents that we have filed on our shelves, (2 pages). This completes your request.

• Yes: Guyaux Landfill, Flores & Fernando St., Colton (2 pages).

N/R: 0163-362-12-0000, 0163-362-26-0000, 0163-381-01-0000 and 0163-381-02-0000

We would like to inform you about Envirostor, a database that provides information and documents on over 5,000 DTSC cleanup sites. Envirostor can be accessed at: http://www.envirostor.dtsc.ca.gov/public.

If you have any questions, would like further information regarding your request, please contact our Regional Records Coordinator at (714) 484-5336. future request please: fax: 714.484.5318 or email both: Jone.Barrio@dtsc.ca.gov & Julie.Johnson@dtsc.ca.gov

Sincerely,

Jone Barrio

Dear Mr. Guyaux:

GUYAUX LANDFILL

The Department of Toxic Substances Control (DTSC) received CERCLA Preliminary Assessment and Site Inspection reports from the United States Environmental Protection Agency (U.S. EPA) for the above mentioned site, located at the end of Flores and Fernando Streets in Colton, San Bernardino County, California.

DTSC has conducted a screening evaluation of the site and added it to the CalSites database. CalSites is a list of sites in California that may have been contaminated with hazardous substances. Based on a review of the information received from the U.S. EPA, DTSC has determined that additional investigation and/or remediation is required at the site.

Oversight by DTSC of any investigation or remediation activities may occur under the Voluntary Cleanup Program (VCP) and will be subject to DTSC oversight cost. Please review the enclosed materials and notify DTSC within 30 days of your decision whether or not to enter the VCP. If you decide to enter into the VCP, please complete the enclosed VCP application

Printed on Recycled Paper

form, submit it to DTSC at the above letterhead address and contact Don Johnson at (818) 551-2862.

If you have any questions regarding this correspondence, please contact Michel Iskarous at (818) 551-2857 or myself at (310) 590-4918.

Dear Mr. Hansen:

We have received your Public Records Act Request for records from the Department of Toxic Substances Control.

After a thorough review of our files we have found that no such records exist at this office pertaining to the sites/facilities referenced above. However, I have forwarded your request to our Cypress office because they may have records for Guyaux Landfill.

We would also like to inform you about Envirostor, a database that provides information and documents on over 5,000 DTSC cleanup sites. Envirostor can be accessed at: http://www.envirostor.dtsc.ca.gov/public. Also, a computer is available in the Central Files of each DTSC Regional Office for use by community members to view Envirostor.

If you have any questions or would like further information regarding your request, please contact me at (818) 717-6521.

Sincerely,

Robert Hardison

1.3: Site Location Information

Street Address: 1280 Jefferson Lane

City: Colton **County:** San Bernardino

State: CA **Zip Code:** 92324

Latitude: 34. 04877 **Longitude:** -117. 32690

Acres: 20.09

1.4 Regulatory Information:

CERCLIS? Yes

RCRA site? No

SLIC site? No

LUFT site? No

UST site? No

WIP site? No

Landfill site? No

Local Agency site? No

Envirostor ID: 60001456

EPA ID: CAD098633744

Geotracker ID: SLT8R2123990

Geotracker Case Number: SLT8R212

Is the contamination petroleum-related? No

Section 2: Operational History

Current owner: Cascade Warehouse
Current operator: Cascade Warehouse
Hazardous materials used:
Dates of operation: 9/7/2004- present

Historical owners/operators that may have used Hazardous Materials onsite: Specify dates and materials that may have been used:

Owners: Amsted Industries, Inc.
Operators: Plexco, Inc.
Hazardous materials used:
Hazardous materials suspected:
Dates of operation: 1988-1995

Owners: Amsted Industries, Inc.
Operators: Griffin Wheel Company
Hazardous materials used:
Hazardous materials suspected:
Dates of operation: 1957-1982

Section 3: Site Impact Information

What is the site setting: Industrial/Residential
Details:

Land use surrounding the site: Industrial/Residential
Details:

Are there residences within 200 feet: Yes
Details:

Are there schools/day care centers within 200 feet: No
Details:

Surface water within 2 miles of the site? Yes
Details: Site is adjacent to the Santa Ana River

Are there any sensitive environments or wetlands within 2 miles of site: No
Details:

Is this site a source of contamination to surface water? No
Details:

Is surface water used for drinking water within 15 miles of the site? No

If yes, is the surface water used for public / commercial supply:

If yes, is the surface water used for private supply:

If yes, approximately how many people served by the surface water:

Details:

Is groundwater used for drinking water within 4 miles of site? Yes

If yes, are the drinking wells public / commercial: Yes **or private**

If yes approximately how many people served by the ground water: 310,000

Details: According to the Western Municipal Water District, the nearest drinking water well is approximately 0.5 to 1.0 mile east of the site. None of the drinking water wells in this target distance ware showed contamination. Based on data provided by the Western Municipal Water District, and on the calculations from the Groundwater Pathway Calculations, there are 42 municipal drinking water wells within the target distance serving approximately 310,000 people, who derive 100 percent of the drinking water solely from groundwater wells located within 4 miles of the site. Please see in the attachment Groundwater Pathway Calculations page.

Is groundwater within 4 miles of the site known to be contaminated with hazardous substances: No

If yes, what hazardous substances :

If yes, do any of the levels exceed drinking water standards?

Details:

Is this site a source of ground water contamination? Yes

Details: Three groundwater monitoring wells (MW-l, MW-2 and MW-3) were constructed and oriented in a southwest to northeast linear configuration across the Griffin site. The groundwater monitoring wells were complete to depths of approximately 45 feet below ground surface (bgs). Groundwater samples were collected and analyzed for metals and VOCs. The analytical data indicated that the concentrations of arsenic (0.999 to 0.675 (mg/L)), cadmium (0.048 to 0.148 mg/L), and lead (0.053 to 0.21 mg/L) in groundwater exceeded the Maximum Contaminant Level/Maximum Contaminant Level Goal (MCI/MCLG) of 0.05, 0.01, and 0.015 mg/L, respectively. Toluene, TCE, and PCE were also detected in the groundwater, with PCE exceeding the MCL of 5.0 ug/L in Well MW2 (12 ug/L) and Well MW3 (15 ug/L).

Any Community Involvement? No

Details:

Site Reconnaissance

1. **Date of visit:** 5/5/2011
2. **Adjacent properties:**

   North: Residential
   South: Vacant land
   East: Railroad
   West: Jefferson Ln.

3. **Structures onsite (e.g. Office Bldg, Paint Booth, Repair Shop etc.):** Large industrial building.

4. **Any visual staining:** No

5. **Any hazardous Materials storage onsite:** Large totes of green liquid in loading dock of the building.

6. **Specify any hazardous Materials used onsite:** No

7. **Indicate if following are present onsite, specify volume, content and how many:**

a) **Drums:** No
b) **ASTs:** One vertical tank with unknown liquid.
c) **USTs:** No
d) **Clarifiers:** No
d) **Other:** No

8. **Any transformers containing PCBs?** No

9. **Any previous sampling results:** Yes

Section 4: Recommendations/Conclusions

Does the site pose an immediate threat and require Removal? No

Have there been any historical releases at the site: Yes,

Based on the site reconnaissance and/or regulatory search is there a potential for a release at the site? No

DTSC's recommendations/conclusions:

DTSC believes that the site may require further investigation and/or remediation. The statement in the RWQCB letter dated July 22, 1994, that "the former lead waste disposal area poses no further threat to water quality" does not address human health. Also, the site is within ½ mile of two drinking water wells.

Summary

The former Griffin Wheel Dump (Griffin) site is approximately 20 acres in size, and is located south of the City of Colton along the north bank of the Santa Ana River. The site was originally established as a foundry to manufacture railroad car wheels. The buildings on-site have been converted to house the Chevron Plexco (Plexco) pipe manufacturing operations.

The Griffin Wheel Company, a subsidiary of Amsted Industries, Inc., operated a foundry that manufactured steel wheels for the railroad industry from 1957 to 1982. Approximately 22,000 cubic yards of wastes, including grinding fines, furnace slag, foundry sands and baghouse dust, were disposed of on-site. Wastes were deposited in this area throughout the period of operation, and in some areas, wastes had reportedly been piled to approximately 8 feet above grade. From 1982 through 1987, the Griffin Wheel Company site was inactive; however, Amsted Industries, Inc. maintained ownership of the site during this period. In early 1988, Plexco, Inc., another subsidiary of Amsted Industries, took over the operations of the Griffin site and began to manufacture polyethylene (PE) pipes. During that same year, shortly after the company's start-up, Plexco, Inc. was purchased by Chevron Chemical Company. Plexco is under the ownership of Chevron Chemical Company and manufactures polyethylene (PE) pipe and PE coatings for metal pipes.

Groundwater:
Three groundwater monitoring wells (MW-I, MW-2 and MW-3) were constructed and oriented in a southwest to northeast linear configuration across the Griffin site. The groundwater monitoring wells were complete to depths of approximately 45 feet below ground surface (bgs). Groundwater samples were collected and analyzed for metals and VOCs. The analytical data indicated that the concentrations of arsenic (0.999 to 0.675 (mg/L)), cadmium (0.048 to 0.148 mg/L), and lead (0.053 to 0.21 mg/L) in groundwater exceeded the Maximum Contaminant Level/Maximum Contaminant Level Goal (MCI/MCLG) of 0.05, 0.01, and 0.015 mg/L, respectively. Low levels of toluene, TCE, and PCE were also detected in the groundwater, with PCE exceeding the MCL of 5.0 ug/L in Well MW2 (12 ug/L) and Well MW3 (15 ug/L). (See Table 2 in the attachment).

Slag Stockpile:
The samples were collected from 11 hand-augured borings placed within the slag stockpile, and from seven shallow surface soil samples collected along the perimeter of the stockpile. Laboratory analysis of the soil borings indicated that three slag stockpile samples (S5, S9, and S10) contained concentrations of lead and zinc that were above CCR Title 22 TILC values. Of these three sample, sample S9 contained the highest concentration of lead (9,520 mg/kg and zinc (12,660 mg/kg). (See Table 3 in the attachment).

The 11 slag samples were also analyzed for VOCs (EPA Method 8240). Toluene was detected in all 11 samples in concentrations ranging from 27 ug/kg in S4 to 130 ug/kg in S1, the toluene detected in the slag samples was discredited due to the use of vinyl tape in packaging, as was the toluene in the soil samples.

Levine-Fricke prepared a final closure report in May of 1993. In a letter dated July 22, 1994, from the RWQCB to the Griffin Wheel Dump parent company, Amsted Industries, it stated that, "the stabilization of the lead waste stockpile and formal closure of the disposal area at the

Plexco facility were completed in April, 1993. The closure report was approved in [the RWQCB's] letter of July 1, 1993". Following the slag stockpile remediation, Levine-Fricke initiated a quarterly groundwater monitoring program. The July 22, 1994 letter from the RWQCB to Amsted Industries further stated that, "Based on [the RWQCB's] analysis of the data contained in the groundwater monitoring reports submitted by Levine-Fricke for the past 6 consecutive quarters, it appears that the former lead waste disposal area poses no further threat to water quality. Therefore, groundwater monitoring at the Chevron Plexco facility will no longer be required." (See the attachment)

DTSC believes that the site may require further investigation and/or remediation. The statement in the RWQCB letter dated July 22, 1994, that "the former lead waste disposal area poses no further threat to water quality" does not address human health. The site is within ½ mile of two drinking water wells.

GROUNDWATER MONITORING AT THE CHEVRON PLEXCO FACILITY - COLTON, CALIFORNIA

Dear Mr. Brosius:

As you are aware, the stabilization of the lead waste stockpile and formal closure of the disposal area at the Plexco facility were completed in April, 1993. The closure report was approved in our letter of July 1, 1993, which also required that you continue the groundwater monitoring program at the site. Based on our analysis of the data contained in the groundwater monitoring reports submitted by Levine-Fricke for the past 6 consecutive quarters, it appears that the former lead waste disposal area poses no further threat to water quality. Therefore, groundwater monitoring at the Chevron Plexco facility will no longer be required.

If you decide to destroy the wells, you must follow the specifications contained in "Monitoring Well Standards", Part III, Sections 16, 17, 18 and 19 of California Well Standards, Bulletin 74-90 of the California Department of Water Resources. Should you decide instead to retain access to the wells for future groundwater monitoring purposes, please be advised that you must provide adequate security to prevent vandalism and possible contamination of the groundwater. Please notify us of your final decision regarding the wells. If you have any questions or concerns, please call me at (909) 782-4904.

Sincerely,

Ann E. Sturdivant

cc: Betsy Curnow, EPA Region IX Planning and Assessment Section Chief
Rachel Loftin, EPA Region IX National Priorities List Coordinator
Philip Armstrong, EPA Region IX, Work Assignment Manager
Ingrid Chen, URS Consultants, Inc.

The SI Scoping Session for the Griffin Wheel Dump Site is tentatively scheduled for 1:30 p.m. on Tuesday, June 13, 1995, at URS Consultants, Inc., 100 California Street, Suite 500, San Francisco, California 94111-4529. Schedule changes may be addressed to Ingrid Chen or Gary Floyd at (415) 774-2700.

1. CERCLA Investigations

The Griffin Wheel Dump was identified as a potential hazardous waste site and entered into the comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) on April 21, 1992. A preliminary assessment (PA) of the Griffin Wheel Dump site (Griffin site; EPA Site Identification Number: CAD983633744) was conducted by Roy F. Weston on behalf of the EPA in January of 1993. As part of the Site Investigation (SI) in progress, URS conducted a site reconnaissance on Thursday, May 25, 1995.

2. Site History

The former Griffin Wheel Dump (Griffin) site is approximately 20 acres in size, and is located south of the City of Colton along the north bank of the Santa Ana River at 1280 Jefferson Lane in Colton, San Bernardino County, California (Latitude: 34°02'55.77"; Longitude: 117°19'31.97"). The existing site is bordered to the north by residential and commercial/light industrial areas; to the south and east by the Santa Ana River Basin; and to the west by a major railroad track corridor. The site was originally established as a foundry to manufacture railroad car wheels. The buildings on-site have been converted to house the Chevron Plexco (Plexco) pipe manufacturing operations. The site consists of a main office building, a large pipe manufacturing warehouse with associated rail sidings and silos for plastic pellet storage, an electrical power substation, and

several pipe storage yards. The site topography is relatively flat, with a slight southwest aspect. The site is paved or graveled with an approximately 3.0-acre section located in the southwest corner of the property, which served as an accumulation point for stockpiling foundry slag wastes. Access to the site is restricted by a chain-link fence with a locked gate. Plexco employs 75 workers and operates 24 hours per day, 7 days per week. There are no residents on the site.

1957 – 1982

The Griffin Wheel Company, a subsidiary of Amsted Industries, Inc., operated a foundry that manufactured steel wheels for the railroad industry from 1957 to 1982. A wheel abrader, metal lathe, or boring machine was housed in a concrete sump where cutting oils were collected and drained to an outside concrete sump. The composition of the cutting oils is unknown. Reportedly the oils were drummed and sold to an oil recycling company. Solid wastes generated during Griffin's operation were deposited on a slag stockpile located in the southwest corner of the property. Approximately 22,000 cubic yards of wastes, including grinding fines, furnace slag, foundry sands and baghouse dust, were disposed of on-site. Wastes were deposited in this area throughout the period of operation, and in some areas, wastes had reportedly been piled to approximately 8 feet above grade.

Water treatment chemicals which included chromate compounds were formerly used on-site in conjunction with a cooling tower. The use of the water treatment chemicals was reportedly discontinued in the mid-1960s. Non-contact cooling water overflow was reportedly discharged on-site to a drainage ditch north of the old wheel plant. In addition to the non-contact cooling water, some water-soluble cutting oils were used on-site and were occasionally present in the discharge. The soil in the ditch was not unusually colored, and no odors were reportedly emitted. It was reported that no hazardous waste was generated on-site.

1982 – 1987

From 1982 through 1987, the Griffin Wheel Company site was inactive; however, Amsted Industries, Inc. maintained ownership of the site during this period.

1988 – 1995

In early 1988, Plexco, Inc., another subsidiary of Amsted Industries, took over the operations of the Griffin site and began to manufacture polyethylene (PE) pipes. During that same year, shortly after the company's start-up, Plexco, Inc. was purchased by Chevron Chemical Company. Plexco is under the ownership of Chevron Chemical Company and currently manufactures polyethylene (PE) pipe and PE coatings for metal pipes.

The process uses dry PE pellets which can be swept or shoveled up and reused in the event of a spill. During manufacturing, the newly formed molten pipe passes through a cooling tank where non-contact water cools the hot piping. The cooling water is circulated and stored in a closed-loop, 11,000-gallon tank. Water is periodically added to the system to compensate for evaporation. The cooling water was changed in 1991. Prior to discharge, the water was analyzed by E.S. Babcock and Sons Laboratory, a State of California Department of Health certified laboratory. The laboratory reports were then submitted to the Regional Water Quality Control Board (RWQCB) and the City of Colton wastewater treatment plant for approval to discharge to the sanitary sewer. The City of Colton gave their permission and specified that the discharge rate not exceed 300 gallons per minute so as not to overload the sewer system. Plexco is planning to install a precipitator system that will remove sludge from the cooling water with the addition of lime. Inferior or off-specification piping is ground into pieces and recycled through the system. Waste streams generated at the facility include used transmission and gear oil, which is routinely

handled by Safety Clean every 3 months due to nominal accumulation. No spills have occurred at the facility during Plexco's operation.

The 1992 CERCLIS listing was prompted when, on April 6, 1992, the Riverside Highland Water Company, a local purveyor of potable water, began receiving odor and taste complaints from the local populace. The Riverside Highland Water Company notified the State of California Environmental Protection Agency's Department of Toxic Substance Control (Cal-EPA DTSC; formerly the Health and Welfare Agency: Department of Health Services Toxic Substances Control Division) of the odor and taste complaints in the potable water. The Cal-EPA DTSC, in turn, recommended to the EPA that a site assessment be conducted for the Griffin Wheel Dump. The EPA then contacted the Riverside Highland Water Company and learned that, based on previous sampling and analysis, the contaminants of concern detected in the drinking water downgradient of the Griffin Wheel Dump included trichloroethylene (TCE), tetrachloroethylene (PCE), other volatile organic analytes (VOAs) and hydrocarbons. The Riverside Highland Water Company provided the EPA with a facsimile transmittal which included the results of the "Closed Loop Stripping Analysis" data for the well in question: Linda Vista Well Number 3. Linda Vista Well Number 3 was located approximately 0.6 mile due south and hydraulically cross gradient of the Griffin Wheel Dump. The PA indicated that low levels of TCE and PCE detected in groundwater samples collected at the site were not attributable to the Griffin Wheel Dump, since neither past or present operations used TCE or PCE. The PA further concluded that the slag stockpile in the southwest corner of the site constituted the one potential source of elevated lead levels in the groundwater identified by various investigations at the site.

The various investigations and a summary of the findings of each are discussed below.

1987 Phase I Environmental Site Assessment - Dames & Moore

The first known investigation at the Griffin Wheel Dump site was a Real Estate Transaction Audit (RETA or Phase I Environmental Site Assessment (Phase I ESA)) performed by Dames & Moore in 1987 on behalf of Amsted Industries, Inc. As part of that investigation, Dames & Moore collected three composite samples in the slag stockpile/surface impoundment area located in the southwest corner of the property. Their inspection of the impoundment concluded that the contents included fine materials, pieces of metal, graphite, wood, brick, and other trash. The samples were analyzed for arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver using the federal Extraction Procedure Toxicity (EPTOX) test. The samples were also analyzed for nickel and zinc using the state Total Threshold Limit Concentrations (TTLC) and Soluble Threshold Limit Concentrations (STLC) tests in accordance with the California Code of Regulations (CCR), Title 22. The three samples were also tested for polychlorinated biphenyls (PCBs) and volatile organic compounds (VOCs). Analytical reports for the three impoundment samples indicated that metals concentrations were less than the federal and state limits for metals, and that PCBs and VOCs were not detected (see Table 1 at the end of this memo).

1989 Phase II Environmental Site Assessment - Dames & Moore

In 1989, Dames & Moore conducted a Phase II ESA at the Griffin site on behalf of Chevron Chemical Company to further characterize the slag stockpile located in the southwest corner of the property. The Phase II ESA focused on the groundwater, slag and ambient air matrices. A summary of each follows:

Groundwater

Three groundwater monitoring wells (MW-1, MW-2 and MW-3) were constructed and oriented in a southwest to northeast linear configuration across the Griffin site. The groundwater monitoring wells were complete to depths of approximately 45 feet below ground surface (bgs). Groundwater samples were collected and analyzed for metals and VOCs. The analytical data indicated that the concentrations of arsenic (0.999 to 0.675 milligrams per liter (mg/L)), cadmium (0.048 to 0.148 mg/L), and lead (0.053 to 0.21 mg/L) in groundwater exceeded the HRS Maximum Contaminant Level/Maximum Contaminant Level Goal (MCL/MCLG) of 0.05, 0.01, and 0.015 mg/L, respectively. Low levels of toluene, TCE, and PCE were also detected in the groundwater, with PCE exceeding the MCL of 5.0 micrograms per liter (µg/L) in Well MW2 (12 µg/L) and Well MW3 (15 µg/L); however, the detection of toluene was discredited due to the expected cross-contamination from the use of vinyl tape in sample preparation and packaging (see Table 2 at the end of this memo).

Slag Stockpile

A total of 11 slag samples was collected for analysis from soil borings that were hand-augured into the slag stockpile. The samples were collected from 11 hand-augured borings placed within the slag stockpile, and from seven shallow surface soil samples collected along the perimeter of the stockpile. Laboratory analysis of the soil borings indicated that three slag stockpile samples (S5, S9, and S10) contained concentrations of lead and zinc that were above CCR Title 22 TTLC values. Of these three sample, sample S9 contained the highest concentration of lead (9,520 milligrams per kilogram (mg/kg)) and zinc (12,660 mg/kg). Due to suspected elevated soluble concentrations of metals in the soil, samples S1, S2, S3, S5, S6, S7, S8, S9, and S10 were further analyzed in accordance with the California Waste Extraction Test (WET) to determine the Soluble Threshold Limit Concentrations (STLC). **Three samples (S2, S9, and S10) exceeded the STLC values for lead,** cadmium and chromium (hexavalent) with STLC values of 23 mg/L, 1.7 mg/L, and 23.1 mg/L, respectively (see Table 3 at the end of this memo).

The 11 slag samples were also analyzed for VOCs (EPA Method 8240). Toluene was detected in all 11 samples in concentrations ranging from 27 micrograms per kilogram (µg/kg) in S4 to 130 µg/kg in S1; however, similar to the false positives for toluene in soil, the toluene detected in the slag samples was also discredited due to the use of vinyl tape in packaging.

Sample S6 and S10 were analyzed for semi-volatile analysis (EPA Method 8270). Sample S6 contained undifferentiated long-chain hydrocarbons at a concentration of 1,700 mg/kg.

Samples S3, S6, S7, S9, and S10 were analyzed for polychlorinated biphenyls (PCBs; EPA Method 8080) and revealed concentrations ranging from ND to 0.312 micrograms per gram (µg/g) (see Table 4 at the end of this memo).

Samples A1 through A6 were collected from the slag stockpile and analyzed for asbestos content. Three of the six samples contained chrysotile asbestos at concentrations ranging from 25 percent (by area, not weight) in sample A1 to 85 percent in sample A2. The levels exceeded the EPA "action level" of 1 percent asbestos in bulk soil samples as determined by Polarized Light Microscopy (PLM); however, photographs taken of the former slag stockpile showed that the stockpile was grassed, which typically provides an acceptable means of encapsulation to eliminate the release of airborne fibers.

Ambient Air

Six air samples (AM 1 through AM6) were collected at the site to assess the airborne concentrations of asbestos and particulate lead. One set of samples was collected from an "upwind" location, while the remaining two sets were collected from "downwind" locations. Analysis of the air samples indicated concentrations of asbestos fibers ranging from 0.0020 asbestiform fibers per cubic centimeter of air (f/cc) to 0.0034 f/cc. All asbestos concentrations were below the 0.1 f/cc action level established by the National Institute of Occupational Safety and Health (NIOSH). Airborne concentrations of particulate lead were not detected in any of the air samples collected at the site.

1990 Subsurface Soil and Groundwater Investigation - McLaren/Hart

In June of 1990, McLaren/Hart submitted a Remedial Investigation Plan (RIP) to the RWQCB. Summaries of the investigative phases follow.

Installation of MW-4

Monitoring well MW-4 was constructed to a total depth of 40 feet bgs and within 100 feet of the northwest corner of the property. Seven soil samples were collected during the construction of MW-4. Silty sand comprises the lithology in this area, which is characteristic of the entire the site. The samples were analyzed for purgeable halocarbons (EPA Method 8010). None of the samples analyzed revealed concentrations of purgeable halocarbons above the laboratory limit of detection.

Slag Stockpile Sampling

McLaren/Hart drilled three additional borings in the slag stockpile and collected five samples from each of the borings for a total of 15 soil samples. Three of the samples exceed the CCR Title 22 standard of 5 parts per million (ppm) soluble lead.

Groundwater Samples

Groundwater samples were collected from each of the four monitoring wells (MW-1, MW-2, MW-3, and MW-4; see Figure 2). Each of the samples was analyzed for hexavalent chromium, cadmium and lead, halogenated volatiles (EPA Method 601), and aromatic volatiles (EPA Method 602). Analytical results indicated that the Maximum Concentration Limit (MCL) for tetrachloroethylene in groundwater of 5 parts per billion (ppb) was exceeded in wells MW-2 and MW-3 (see Figure 2). **Lead was detected in downgradient well MW-1 at 0.3 ppb, but was ND in upgradient wells MW-2, MW-3 and MW-4** (see Table 5 at the end of this memo). Groundwater elevation measurements taken at the four wells indicated a southwesterly groundwater flow direction at a gradient of approximately 0.002 feet per foot (feet/foot).

1991 Slag Stockpile Sampling - McLaren/Hart

In November of 1991, McLaren/Hart submitted a "Characterization Plan" to the RWQCB calling for the collection and analysis of 120 additional samples from the slag stockpile. Analytical results for the additional slag stockpile samples indicated that the CCR Title 22 TTLC (1,000 mg/kg) and EPA Toxic Characteristic Leaching Procedure (TCLP; 5.0 mg/L) levels for lead were exceeded by TTLC concentrations as high as 13,000 mg/kg, and TCLP concentrations as high as 30 mg/L (see Table 6 at the end of this memo).

1993 Preliminary Assessment - Roy F. Weston

In January of 1993, Roy F. Weston conducted a Preliminary Assessment (PA) of the Griffin Wheel Dump on behalf of the EPA. At the time of the PA, a slag stockpile remediation plan had been prepared by Levine-Fricke and was being reviewed by the RWQCB. No environmental samples were collected during the PA. Based on the data available at the time of the PA, Roy F. Weston stated that the slag stockpile was the "one potential source of contamination" at the Griffin Wheel Dump.

1993 Slag Stockpile Remediation – Levine-Fricke

In April of 1993, Levine-Fricke remediated the slag stockpile. The remediation involved a stabilization/fixation process that mixed the lead-contaminated soil with a minimum of 10 percent cement. The stabilized material was then placed in an excavated pit in the southwest corner of the site (see Figure 3). Levine-Fricke prepared a final closure report in May of 1993. A letter dated July 22, 1994, from the RWQCB to the Griffin Wheel Dump parent company, Amsted Industries, stated that, "the stabilization of the lead waste stockpile and formal closure of the disposal area at the Plexco facility were completed in April, 1993. The closure report was approved in [the RWQCB's] letter of July 1, 1993."

Following the slag stockpile remediation, Levine-Fricke initiated a quarterly groundwater monitoring program. The July 22, 1994 letter from the RWQCB to Amsted Industries further stated that, "Based on [the RWQCB's] analysis of the data contained in the groundwater monitoring reports submitted by Levine-Fricke for the past 6 consecutive quarters, it appears that the former lead waste disposal area poses no further threat to water quality. Therefore, groundwater monitoring at the Chevron Plexco facility will no longer be required."

3. Regulatory Involvement

Several regulatory agencies are involved with the Plexco facility in various capacities. These agencies include the San Bernardino County Department of Environmental Health (DEH); the City of Colton Fire Department (CFD); the Cal-EPA DTSC; the South Coast Air Quality Management District (SCAQMD); and the Santa Ana RWQCB. The agencies' involvement is summarized below.

San Bernardino County Department of Environmental Health

The Plexco facility maintains a Business Plan with the SBCDEH. The plan identifies the facility layout and operations in order to assist firefighters and emergency responders in the event of a fire or other emergency. The plan is in the process of being revised at the request of a new, recently appointed facility manager. A National Pollutant Discharge Elimination System (NPDES) permit is not required for the Plexco facility because all chemicals are used and stored indoors.

City of Colton Fire Department

The Plexco facility is periodically inspected by the City of Colton Fire Department. As part of its community awareness program, Chevron sponsored an "open house" event in which residents and fire departments from the surrounding community were invited to tour the Plexco facility in order to see the innocuous nature of the operations first-hand. At the peak of the "open house" event Plexco was running four tours per day over a 2-week period.

Department of Toxic Substances Control

During the PA conducted in January of 1993, no file could be located at the DTSC. The Griffin site is listed in the Calsites database as "Plexco Inc.," and the notation in the database indicated that no further action would be taken by the DTSC. An inquiry during the 1995 SI indicated that there has been no change in the status of the DTSC's involvement at the facility since the 1993 PA.

South Coast Air Quality Management District

The Griffin Wheel Company was issued 24 separate air permits for their operations. AQMD rules required an air permit for every source and every pollution control device in the plant. Permits were issued for kilns, sand heaters, the electric arc furnace, the paint spray booth, and several other pieces of equipment. The site reconnaissance conducted during the SI indicated that the premises had been renovated to accommodate the machinery associated with the Plexco pipe manufacturing process. The facility also applies polyethylene coatings to customer-supplied steel pipe as a corrosion inhibitor. In accordance with the AQMD, Plexco maintains an air permit for the coating application process. The two on-site baghouses associated with the on-site wheelabrator system are exempt from permit requirements by the AQMD; however, Plexco certifies the baghouses semi-annually as a quality control measure.

Santa Ana Regional Water Quality Control Board

The RWQCB is the *lead agency* at the Griffin Wheel Dump. The RWQCB became involved with the site in 1990 when they were asked to review a remedial investigation plan submitted by McLaren/Hart on behalf of Amsted Industries. Since that time, the slag stockpile remediation and quarterly groundwater monitoring has been completed to the satisfaction of the RWQCB. The RWQCB issued a letter to this effect dated July 22, 1994, to Amsted Industries, the former parent company of Griffin Wheel.

The Field Photography Log Sheets of the site reconnaissance are attached at the end of this report for reference.

5. HRS Considerations

- The **groundwater pathway** was identified as the primary pathway of concern at the site, following an observed release of lead from the site to the underlying groundwater. Attribution of the observed release was based on the detection of lead in the former slag stockpile by Dames & Moore in 1989 at a soluble concentration of 23 mg/L, which exceeded the CCR Title 22 STLC for lead of 5 mg/L. The analysis of groundwater collected by Levine-Fricke in June of 1990 from downgradient monitoring well MW-1 revealed a concentration of 0.3 ppb, while lead was ND in the remaining on-site, upgradient wells MW-2, MW-3, and MW-4. Published data from the Western Municipal Water District indicate that the average and range background concentrations for lead in the Riverside area that extends north of the Griffin site are ND.

- The **air pathway** is not a pathway of concern, based on the results of ambient air sampling conducted on-site by Dames & Moore, which revealed ND concentrations of particulate lead. This is further substantiated by the fact that the source of potential airborne particulate lead (the former slag stockpile)

underwent a remedial stabilization/fixation process and was buried on-site in 1993.

- The **surface water pathway** is not a pathway of concern. There are no hard data to show attribution to the Santa Ana River located south and east of the site. The Santa Ana River flows intermittently and is not a drinking water source.

- The **soil pathway** is not a pathway of concern, since there are no residents on-site, and there is no recreational use of the area. This is further substantiated by the fact that the source (the former slag stockpile) underwent a remedial stabilization/fixation process and was buried on-site in 1993. Additionally, the access road to the site is gated and locked.

5.1 Groundwater

The primary pathway of concern at the Griffin Wheel Dump site is groundwater. The underlying site stratigraphy is composed of sands and silty sands. There are no known continuous aquitards present beneath the site; therefore, all water wells in the region draw from what is considered a single, unconfined aquifer to supply drinking water to approximately 42,445 residents within the 4-mile target distance. The aquifer also supplies irrigation water to the surrounding agricultural users. The local groundwater table ranges seasonally from approximately 16 feet bgs to 35 feet bgs, and the groundwater flow direction is to the southwest at a gradient of 0.002 feet per foot. Following the remedial stabilization/fixation process in 1993, the former 22,000-cubic-yard slag stockpile was buried on-site at a depth of 12 feet bgs.

URS-Proposed Action

Sufficient analytical data currently exist for the Griffin Wheel Dump site to support the EPA's evaluation at this stage of investigation. Furthermore, a letter dated July 22, 1994, from the RWQCB to the Griffin Wheel Dump parent company, Amsted Industries, stated that "[T]he stabilization of the lead waste stockpile and formal closure of the disposal area at the Plexco facility were completed in April, 1993. The closure report was approved in [the RWQCB's] letter of July 1, 1993." The letter further stated that, "Based on [the RWQCB's] analysis of the data contained in the groundwater monitoring reports submitted by Levine-Fricke for the past 6 consecutive quarters, it appears that the former lead waste disposal area poses no further threat to water quality. Therefore, groundwater monitoring at the Chevron Plexco facility will no longer be required."

* Has all monitoring data received been shown ND for VOCs + Lead levels?

Observed Release of Lead to Groundwater

Groundwater Exposure Pathway

GW-1: Observed Release. In accordance with Section 2.3 and Table 2-3, an observed release is established since the background (upgradient) concentration of lead is Non-Detect (ND) in wells MW-2, MW-3, and MW-4. The June 1990 analytical results for the groundwater sample collected from well MW-1 revealed a concentration of lead of 0.3 micrograms of lead per liter of groundwater (µg/L). Section 2.3 instructs to assign a value of **550.**

GW-2: Toxicity/Mobility. Lead was detected in MW-1 on-site at a concentration of 0.3 µg/L. In accordance with the Superfund Chemical Data Matrix (SCDM), lead is assigned a Toxicity Value of 10,000. A Mobility Value of 1.0 was assigned, since an observed release is established. Mobility x Toxicity (1.0 x 10,000 = **10,000**).

GW-3: Hazardous Waste Quantity. Review of the Closure Report for the slag stockpile that was prepared by Amsted's environmental consultant, Levine-Fricke, stated that "A total of approximately 22,000 cubic yards of soil was treated and placed in the pit during the (slag stockpile stabilization/fixation) project. URS selected the "pile" measure from Table 2-5 to yield an equation for assigning a value of V/2.5, or 22,000/2.5 = 8,800. Applying this value to Table 2-6 yields a Hazardous Waste Quantity Factor Value of **100.**

GW-4: Nearest Well. According to the Western Municipal Water District, the nearest drinking water well is approximately 0.5 to 1.0 mile east of the site. None of the drinking water wells in this target distance is subject to Level I or II contamination. Based on Table 3-11, a Nearest Well Factor Value (1/2 to 1 mile) of **9** is assigned.

GW-5: Potential Contamination. Based on data provided by the Western Municipal Water District, and on the calculations from the Groundwater Pathway Calculations, there are 42 municipal drinking water wells within the target distance serving approximately 310,000 people, who derive 100 percent of the drinking water solely from groundwater wells located within 4 miles of the site. Table 3-12 yields Distance-Weighted Population Values "Other Than Karst," which total 42,445, or a Potential Contamination Value of 42,445/10 = **4,245**. Please see the attached Groundwater Pathway Calculations page.

GW-6: Resources. Groundwater is drawn from target wells in the area to irrigate a 5-acre minimum of commercial food crops or commercial forage crops. Section 3.3.3 specifies a Resources Factor Value of **5**.

GW-7: Wellhead Protection Area. There are no wellhead protection areas in California. Section 3.3.4 specifies a Wellhead Protection Area Factor Value of **0.**

TABLE 1
Phase 1 Assessment Analytical Results
Landfill Samples

PARAMETER	UNITS	SAMPLE NO. 1	SAMPLE NO. 2	SAMPLE NO. 3	EP TOXICITY LIMIT
EP Toxicity					
Arsenic	mg/L	ND	ND	ND	5.0

Review & Concurrence: Greg Holmes

SITE STATUS:

The Griffin Wheel Company manufactured steel wheels for the railroad industry from 1957 until 1982. This site occupies 20.9 acres. Solid wastes consisting of grinding fines, furnace slag, foundry sands, and baghouse dust were deposited on approximately 3 acres of the site. The approximately 22,000 cubic yards of the slag stockpile was extensively tested and characterized. The slag pile contained high levels of metals including lead, chromium, cadmium, and zinc.

The Santa Ana Regional Water Quality Control Board (RWQCB) assumed the role of lead regulatory agency for the site. The RWQCB approved a Remedial Action Plan (RAP), which involved on-site stabilization/fixation of the slag. This RAP was successfully completed in April, 1993. A quarterly groundwater monitoring program was initiated and completed by Levine-Fricke to the satisfaction of the RWQCB.

On July 1, 1993, the RWQCB granted closure of the disposal area.

On July 22, 1994, the RWQCB wrote a letter to the operator of the site stating that stabilization of the lead waste stockpile and formal closure of the disposal area at this site was completed in April, 1993. The closure report had been approved by the RWQCB's July 1, 1993 letter. The data that the RWQCB had obtained from Levine-

Fricke for the past 6 consecutive quarterly groundwater samples showed that this former lead waste disposal area posed no further threat to water quality. Please see attached pages from the September 19, 1995 memorandum from URS Consultants, Inc. to U.S. EPA and the July 8, 1994 Quarterly Groundwater Monitoring Report prepared by Levine-Fricke for the site. Therefore, the RWQCB stated that that groundwater monitoring at the site was no longer required.

On December 21, 2001, Mr. Joseph Cully of DTSC visited the site. Mr. Cully observed that the facility is now doing business as Performance Pipe, and a facility representative told him that the property owner is Chevron Phillips Chemical Company, Limited Partnership. The facility representative explained that Performance Pipe makes pipelines for refineries and gasoline stations. No hazardous waste was stored, handled, or otherwise present at the time of this site visit. The facility representative did not allow Mr. Cully to take any pictures of the facility due to trade secret and competition issues.

PLANNED CLEAN-UP ACTIVITIES:

None needed.

1.0 INTRODUCTION

Presented in this report is Dames & Moore's Phase II site characterization of the Plexco Facilities located in Colton, California (Figure 1). Two issues of environmental concern were addressed in this report:

- A slag pile containing debris from the former Griffin Wheel Manufacturing facility; and
- Potential ground-water contamination.

It was our opinion that sampling the materials in the slag pile would aid in providing a greater level of confidence concerning the nature of the pile. To provide this confidence level, we conducted a program of sample collection and chemical testing.

Additionally, to evaluate the condition of the ground-water beneath the site, we conducted a program of ground-water monitoring well installation, ground-water sampling, and chemical testing.

2.0 PURPOSE AND SCOPE

Based on the potential presence of hazardous substances, we have conducted two field investigative tasks which included an evaluation of the slag pile and ground-water beneath the site. The purpose of this investigation was to provide Chevron Chemical Company with an increased level of confidence as to the potential presence of hazardous substances in the slag pile and ground-water. More specifically, the purpose of the slag pile investigation was to provide an acceptable level of confidence through a systematic random sampling plan as to whether these materials contain metals, volatile and semi-volatile organic compounds, and polychlorinated biphenyls (PCBs) in potentially hazardous concentrations. The

purpose of the ground-water investigation was to evaluate the potential presence of metals and volatile organic compounds (VOCs) in the ground-water beneath the site. An outline of the scope of services for each of these tasks is presented below.

2.1 SLAG PILE INVESTIGATION

The scope of services to investigate whether the slag pile contains potentially hazardous materials included:

- Preparation of a health and safety plan;
- Visually assessing the perimeter of the slag pile;
- Delineation of the slag pile area into a grid pattern with approximately 60-foot by 60-foot grid cells;
- Advancing one hand-augered boring to a maximum depth of 4.5 feet below ground surface (bgs) or refusal within each of 11 randomly selected grid cells on the slag pile (a total of 11 hand-augered borings, as shown in Figure 3 2);
- Obtaining soil samples from depths ranging between 2 feet and 4.5 feet in the hand-augered borings;
- Analyzing slag pile samples (S1 through S10) and a background sample (S11) in the laboratory for pH, California Code of Regulations (CCR) Title 22 metals, volatile and semi-volatile organic compounds (VOCs) according to EPA Methods 8240 and 8270, respectively, and (PCBs) according to EPA Method Number 8080;
- Obtained 7 shallow surface soil samples along the approximate perimeter of the slag pile and chemically

testing for CCR Title 22 metals. The soils were obtained from approximately 6 inches below the ground surface. The purpose of this investigation was to provide data for the placement of a fence within which potentially hazardous materials from the slag pile would be contained;

- Performing a limited investigation for asbestos containing materials (ACMs) by obtaining 6 samples of suspected ACM at various points on the slag pile; and

- Conducting a 24-hour air monitoring program for the presence of airborne asbestos and particulate lead in the vicinity of the slag pile.

2.2 GROUND-WATER INVESTIGATION

The scope of services to investigate whether ground-water beneath the subject parcel has been degraded by on-site and/or off-site sources included the following tasks:

- Performing a geophysical survey of the well locations to identify potential subsurface obstructions to drilling;

- Drilling and installation of three ground-water monitoring wells to a maximum depth of 47 feet below the existing ground surface;

- Collection of soil samples at 5-foot intervals in the borings. One soil sample per boring at 5 feet bgs was selected for chemical analysis;

- Surveying the locations and elevations of the well casings and obtaining ground-water elevations;

- Collection of water samples for chemical analyses; and

- Analysis of water samples for Title 22 metals and for VOCs by EPA Method 624.

2.3 DATA EVALUATION AND REPORT PREPARATION

The scope of services to evaluate the data and report the results and findings of the field and laboratory data included the following tasks:

- Performing a statistical analysis on laboratory data from the slag pile investigation to assess whether one or more chemical contaminants in the pile are present at concentrations considered hazardous by appropriate regulatory agencies.

- Compilation of this draft report presenting the results of the slag pile investigation and perimeter assessment, ground-water sampling and chemical testing data along with our conclusions.

3.0 INVESTIGATIVE METHODS

3.1 SLAG PILE INVESTIGATION

3.1.1 Hand-Augered Borings

Hand-augered borings were advanced to a maximum depth of 4.5 feet bgs, in the slag pile. Hand-augered borings were advanced to 6 inches bgs for the perimeter assessment. One soil sample was collected from each boring using a ring core sampler. Samples from the slag pile were obtained in 1-inch I.D. stainless steel tubes and packaged for shipment to the analytical laboratory by covering the soil exposed at the ends of the tubes with Teflon sheets, fitting each end with plastic end caps, and sealing the caps to the tubes with vinyl tape.

Chain-of-custody seals were applied over the sealed samples. Sample labels were affixed to the end caps and contained the following information: (1) boring number, (2) sample number, (3) depth, (4) date and time, (5) collector name, (6) owner, and (7) sample location. Appropriately sealed and labeled samples were stored in the field in coolers refrigerated with ice. Chain-of-custody records were completed in the field and were transferred with the samples to the analytical laboratory.

Samples from the perimeter of the slag pile were obtained in glass jars and labeled as described above.

Before collection of each soil sample, the hand auger barrel was washed in a dilute Alconox solution rinsed with fresh water, and final rinsed with distilled water.

Drilling and soil sampling was conducted under the technical supervision of a Dames & Moore geologist in the field. Soil vapor concentrations in the borings were measured with a Century Systems Model 128 or similar organic vapor analyzer (OVA). The OVA was used to evaluate whether organic vapors, which may be related to soil contamination, are present in significant concentrations. The on-site Dames & Moore representative maintained a detailed record of the subsurface materials and OVA readings.

3.1.2 SLAG CHEMICAL TESTING PROGRAM

Chemical testing of the slag samples was performed by a State Certified Analytical Laboratory on a rush priority basis. One sample per boring was tested for CCR metals (total concentration), VOCs (EPA Method 8240), and PCBs (EPA Method 8080). Additionally, 2 samples were selected for semi-volatile analysis (EPA Method 8270). Upon the receipt and review of total metal concentrations, the Waste Extraction Test (WET) was conducted for 24 samples that exceeded STLC values for some specific metals concentrations as

described by the CCR, Title 22 Article II criteria. Nine samples were tested for hexavalent chromium, four for copper, three for cadmium, three for lead, two for zinc, two for arsenic, and one for nickel. The seven perimeter assessment samples were analyzed for CCR metals.

3.1.3 ASBESTOS INVESTIGATION

A Dames & Moore Asbestos Hazard Emergency Recovery Act (AHERA) certified inspector conducted a limited physical survey of the slag pile located on the Plexco facility. After an initial walk-around inspection, six samples were taken and submitted to a state certified lab for asbestos analysis.

3.1.4 STATISTICAL ANALYSIS

A statistical analysis was performed by following the EPA recommended procedure (EPA, 1982) by calculating the mean ($\bar{x}$), variance (s^2), standard deviation(s) and standard error ($s_{\bar{x}}$) for total lead concentrations in the 10 random samples obtained from the slag pile (Appendix C). Lead was chosen for its presence in elevated concentrations in the pile, and as a worst case example. Additionally, a student "t" value was calculated to provide a degree of freedom value.

From the statistical analysis, lower and upper values (CIs) were established within which lead concentrations for a random sample from the slag pile would have an 80 percent probability of falling. In addition, the appropriate number of samples (N) that should have been collected to arrive at statistically defendable values were also calculated.

The results of our calculations indicate that at least 44 samples are needed to perform a statistically defendable calculation. It should be noted that the appropriate number of samples are based on the statistical analysis of the first set of

samples. It is not possible to determine this number at the onset of an investigation. Therefore, to arrive at a set of statistically defendable values (including $\bar{x}$, s^2, s, $s_{\bar{x}}$, CIs, and N), 34 additional samples would be needed for analysis. This number may change based on the statistical results of the new set of data. If the statistical analyses indicate the need for more samples to be analyzed, then an additional number of samples will be chosen for chemical testing.

A summary of values obtained from calculations along with general procedures used in the statistical analysis is presented in Appendix C. A brief discussion of results is presented in Section 5.0 of this report.

3.1.5 AIR SAMPLING

Perimeter air sampling was utilized in order to maximize our efforts in determining airborne asbestos and lead levels. Six SKC personal air sampling pumps were placed around the slag pile. Two pumps were placed upwind together (Figure 3), one with a total lead dust cassette and the other an asbestos cartridge. Two separate stations were set up downwind, also measuring for asbestos and total lead dust at each station. Pumps were calibrated to collect one liter of air per minute for 24 hours.

3.2 GROUND-WATER INVESTIGATION

3.2.1 DRILLING AND SOIL SAMPLING

Three soil borings were drilled and completed as ground-water monitoring wells at locations shown on Figure 2. The borings were drilled to a total maximum depth of 47 feet bgs using a hydraulic drive drill rig equipped with 10-inch diameter hollow stem augers.

Relatively undisturbed soil samples were collected through the hollow stem of the auger at 5-foot intervals using a Dames and

Moore U-Type or similar sampler. The sampler was driven 18 inches (or until refusal) with a standard 30-inch drop of a 140-pound hammer. Hammer blow counts were recorded every six inches over the 18-inch sampling interval. A Dames & Moore geologist maintained a detailed log of the borings (Appendix A).

Samplers were fitted with 2.5-inch diameter, 3-inch long stainless steel tubes. The soil in the first sample tubes was retained for chemical testing. The exposed soil on each end of the first tube was covered with Teflon sheets, fitted with plastic end caps, and sealed with vinyl tape.

Appropriately sealed and labeled samples were stored in the field in coolers refrigerated with ice. Chain-of-custody records were completed in the field and were transferred with the samples to the analytical laboratory.

Soil cuttings from the borings were placed in DOT-approved drums and stored on-site, pending evaluation of disposal options.

3.2.2 MONITORING WELL INSTALLATION

Monitoring wells were installed in the borehole and constructed of 4-inch diameter, schedule 40, flush threaded PVC casing and screen. The screen was slotted with 0.010-inch horizontal slots and extended from approximately five feet above the water table to approximately 15 feet below the water table. Prior to installation, all well materials were steam cleaned. The annular spaces adjacent to the well screens were filled with pre-washed number 2 Monterey sand from the base of the well to 6 inches above the screened interval. A two-foot thick bentonite seal was installed above the sand pack. The remaining annular space was backfilled with a cement/bentonite grout (Appendix A). The wells were completed below ground surface in a locking steel casing and finished to grade in an aluminum water-tight monument box.

Following installation, the well heads were surveyed and tied into a local datum reference point.

The wells were developed using a vented surge block and bailer until the produced water was relatively free of sediment and the pH, conductivity, and temperature had stabilized. Approximately three well volumes were removed during well development. Water produced during development was collected in 55-gallon Department of Transportation (DOT) approved drums and left on-site for proper disposal.

3.2.3 GROUND-WATER SAMPLING

Ground-water samples were collected from each of the observation wells immediately following well development. Water samples were collected using a Teflon bailer. Samples from each well were collected in VOA bottles supplied by the analytical laboratory. The VOA bottles were filled using the submerged fill technique leaving no headspace in the bottle. The sample bottles were labeled with the following information: well number, sample number, date, collector name, owner, and location. Samples were stored in the field and delivered to the laboratory in ice chests cooled with ice. Chain-of-custody records were maintained for each sample. The bailer was washed between wells using an Alconox solution, rinsed with fresh water and followed by rinsing with distilled water.

3.2.4 MONITORING WELL CHEMICAL TESTING PROGRAM

Analytical testing of soil and water samples from the monitoring wells was performed by a State Certified Analytical Laboratory on a rush priority basis. One soil sample from 5 feet bgs in each boring was analyzed for metals, VOCs, and PCBs according to EPA Methods used for the slag pile characterization discussed above. One water sample from each well was submitted for chemical testing. Water samples were chemically analyzed for VOCs according to EPA Method 624 and for CCR metals.

4.0 INVESTIGATIVE RESULT

4.1 SLAG PILE CHARACTERIZATION

4.1.1 ANALYTICAL LABORATORY RESULTS

Laboratory analyses indicated that 3 slag pile samples, S5, S9 and S10, were above the California TTLC values for both lead and zinc (Table 1). Of the 3 samples, S9 contained the highest concentrations of metals with 9,520 parts per million (ppm) lead and 12,660 ppm of zinc.

As shown in Table 1, Samples S1, S2, S3, S5, S6, S7, S8, S9, and S10 were chosen for WET analyses based on elevated concentrations of various metals detected by the laboratory. Of the 24 analyses performed, soluble concentrations above the California STLC values for lead, cadmium and chromium were detected in 3 samples from the slag pile. Sample S2 contained 23 ppm lead; S9 contained 1.12 ppm cadmium, 29.8 ppm copper and 23.1 ppm hexavalent chromium; and S10 contained 1.70 ppm cadmium.

The samples from the slag pile were analyzed in the laboratory for volatile organic compounds (VOCs) according to EPA method 8240. Two samples, S6 and S10, were chosen for semi-volatile analyses according to EPA method 8270. Toluene was detected in the slag pile samples in concentrations ranging from 27 parts per billion (ppb) in S4 to 130 ppb in S1. Additionally, 1700 ppm of undifferentiated long chain hydrocarbons were detected in sample S6 by EPA method 8270. Toluene and undifferentiated long chain hydrocarbons were the only concentrations of potentially hazardous materials detected by the laboratory in the slag pile samples.

Concentrations of PCBs were reported by the laboratory to range from none detected in samples S1, S2, S4, S5, S8 and S11 to 0.312 ppm in sample S7. The pH of the slag pile samples ranged from 8.75 in S2 and S11 to 12.10 in Sample S7.

Seven soil samples (S12 through S18) were obtained from locations around the slag pile (Figure 3). Results of the laboratory analyses indicated that elevated concentrations of chromium and lead were present around the apparent perimeter of the pile. Although CCR metal concentrations in Samples S11 through S18 were below TTLC values, Samples S13, S14, S15, and S18 exceeded 50 ppm (10X the STLC value of 5 ppm) for either hexavalent chromium or lead. Sample S13 contained 130 ppm chromium and 656 ppm lead, S14 contained 51.1 ppm chromium and 157 ppm lead, S15 contained 109 ppm chromium and S18 contained 174 ppm lead. The seven samples obtained from the perimeter of the pile were below both the California TTLC values and 10X the California STLC values for the other CCR metals.

Chrysotile asbestos was present in three (A1, A2, A4) of the six bulk samples (A1 through A6) obtained from the slag pile. Two of the samples, A2 and A4, were obtained from material that appeared to be discarded flame retardant fabric. Sample A2 and A4 contained 85 percent and 60 percent chrysotile asbestos, respectively. Sample A1 appeared to be a corrugated tile and was reported to contain 25 percent chrysotile asbestos.

Results from the air monitoring samples indicate the presence of small quantities of airborne fibers, but do not indicate the presence of airborne lead in detectable quantities. Sample AM1 contained 0.0034 fibers per cubic centimeter (f/cc), AM2, 0.0020 f/cc, and AM3, 0.0025 f/cc.

4.2 GROUND WATER CONDITIONS

4.2.1 SUBSURFACE GEOLOGY

Based on our interpretation of the information recorded on the logs of borings and from field observations made during drilling and well installation, the site is underlain by predominately medium to coarse grained sandy alluvium. These sands are poorly graded but generally contain some fine-grained material. Coarse

gravel lenses were present in each boring at varying depths and a silty sand was present between the ground surface and 1 foot bgs in boring MW2. Unusual odors or discolored soils were not encountered during the course of drilling or well installation. Water saturated soils were encountered between 28.5 and 31 feet bgs in the borings.

4.2.2 GROUND WATER DIRECTION AND FLOW

The northernmost rim of each monitoring well was marked and surveyed by a state registered professional engineer. Depth to ground-water measurements were obtained from the wells on August 3, 1989. Ground-water elevations were calculated at 877.83 feet above Mean Sea Level (MSL) in MW1, 879.83 feet above MSL in MW2 and 881.70 above MSL in MW3. A ground-water gradient to the southwest was calculated from these ground-water elevations using the 3-point method (Figure 4).

4.2.3 ANALYTICAL LABORATORY RESULTS

Laboratory data from the three monitoring wells indicated the presence of elevated concentrations of some solvents and metals in the ground water beneath the site. A water sample from MW1 contained concentrations of tetrachloroethylene (PCE) and trichloroethylene (TCE) in concentrations of 3.1 ppb and 0.8 ppb, respectively. MW2 contained 12.0 ppb PCE and 1.6 ppb TCE, and MW3 contained 15 ppb PCE and 1.0 ppb TCE. Toluene was detected in MW2 and MW3 in concentrations of 500 ppb and 6,400 ppb, respectively.

Water samples from the wells contained arsenic, lead, and total chromium (Table 2) concentrations exceeding the U.S. Environmental Protection Agency (EPA) Maximum Contaminant Levels (MCL). Additionally, ground water from MW2 and MW3 was reported to be above the MCL for barium and cadmium.

Soils from 5 feet bgs from the three borings did not contain concentrations of metals above either the California TTLC values or 10X the California STLC values. Toluene was detected by the laboratory in concentrations ranging between 23.0 ppm and 49.0 ppm in these three samples (Table 2).

5.0 DISCUSSION

Based on the results of chemical analyses as reported by the laboratory, four samples from the slag pile, S2, S5, S9 and S10, would be classified as hazardous wastes by containing concentrations of some metals exceeding either the Soluble Threshold Limit Concentrations (STLC) and/or the Total Threshold Limit Concentration (TTLC) values as defined by California Code of Regulations, Title 22, Article II criteria. Samples S5, S9, and S10 contained lead and zinc concentrations above the TTLC values of 1,000 ppm and 2,500 ppm, respectively (Table 1). Sample S5 contained 2,616 ppm lead and 5,540 ppm zinc, Sample S9 contained 9,520 ppm lead and 12,600 zinc, and Sample S10 contained 3,040 ppm lead and 6,150 ppm zinc. Based on the results of the WET analyses, Samples S2, S9, and S10 contained either lead, cadmium, copper or hexavalent chromium that exceeded the STLC values for these compounds of 5 ppm, 1 ppm, 25 ppm, and 5 ppm, respectively. Sample S2 contained 23 ppm lead, S9 contained 1.12 ppm cadmium, 29.8 ppm copper and 23.1 ppm hexavalent chromium, and S10 contained 1.70 ppm cadmium.

The statistical analysis indicates that there is an 80 percent probability that a random sample obtained from this slag pile would have a total lead concentration of between 314 ppm and 2934 ppm. The mean ($\bar{x}$) for lead concentrations was calculated as 1624.20. According to the EPA procedure used for this analysis, if $\bar{x}$ is equal or greater than the applicable regulatory threshold (1,000 ppm) and $\bar{x}$ is believed to be an accurate estimate, the subject chemical (lead in this case) is considered to be present in the

waste at a hazardous concentration. However, as discussed in Subsection 3.1.4, the appropriate number of samples (N) needed to perform a valid statistical analysis was calculated as 44, as opposed to 10 samples that were collected for this study.

Results of laboratory tests by EPA Methods 8270 and 8240 indicate that the samples obtained from the slag pile were not impacted by VOCs and semi-volatile compounds. However, most of the samples contained concentrations of toluene. After a careful review of field and laboratory techniques, and several conversations with laboratory personnel, a consensus was reached that there is a high likelihood that the toluene in the slag, soil, and water samples represent residual concentrations of VOCs from the vinyl tape used in sample packaging.

The 1,700 ppm undifferentiated hydrocarbons detected by EPA 8270 in Sample S6 indicates the presence of long chain hydrocarbons in the slag pile. The unofficial threshold for organic concentrations, other than certain priority pollutants, is 1,000 ppm. However, 1,700 ppm organic concentration was only observed in one sample and its importance cannot be assessed at this time.

Concentrations for PCBs in samples from the slag pile were reported by the laboratory to be below 5.0 ppm, the STLC value for this compound. Additionally, samples from the pile were reported to be within pH limits of 2.0 and 12.0 used to define a substance as corrosive and hazardous according to the CCR.

The results of the limited asbestos investigation indicate that both friable and non-friable asbestos are present in and around the slag pile. The potential for asbestos-containing materials to be friable is assessed in the field from visual observation, and Sample A2 and A4 appear to contain friable asbestos in flame retardant material. Sample A1 appeared to contain non-friable asbestos in a tile-like material.

According to EPA 40 CFR Part 257, a material is considered to be an Asbestos-Containing Material (ACM) if it contains greater than one percent asbestos. Samples A1, A2 and A4 were reported to contain chrysotile asbestos above one percent, and as such, this material must be treated as a hazardous waste according to this regulation. The volume of asbestos-containing materials in and around the slag pile could not be assessed from this investigation.

Laboratory data from the air monitoring samples do not indicate the presence of airborne lead in detectable quantities. Additionally, airborne fibers are present in these samples in quantities below the 0.1 f/cc action level set forth by the Occupational Health and Safety Agency (OSHA).

The MCL drinking water standards, established by the EPA for arsenic, barium, cadmium, total chromium and lead are 0.05 ppm, 1.0 ppm, 0.01 ppm, 0.05 ppm and 0.050 ppm, respectively. The laboratory reported that samples from MW1 contained 0.0679 ppm arsenic, 0.17 ppm total chromium and 0.053 ppm lead ; MW2 contained 0.0955 ppm arsenic, 1.76 ppm barium, 0.102 ppm cadmium, 0.416 ppm total chromium, and 0.13 ppm lead; and MW3 contained 0.0999 ppm arsenic, 1.93 ppm barium, 0.148 ppm cadmium, 0.588 ppm total chromium and 0.21 ppm lead.

The MCL drinking water standard established by the EPA for PCE is 5 ppb. As such, water samples from Well MW2 and MW3 contained PCE concentrations above the 5 ppb action level. Well MW2 contained 12 ppb PCE and Well MW3 contained 15 ppb PCE. Although laboratory data do not indicate the presence of PCE in samples obtained for analysis from the slag pile, an assessment of potential on-site or off-site sources for PCE in ground-water was not performed for this investigation.

6.0 RECOMMENDATIONS

Based on the results of this Phase II investigation we recommend that access of unauthorized individuals to the pile be minimized. Additionally, we recommend that legal counsel be retained to assist in determining reporting requirements to local and state regulatory agencies.

The analytical laboratory results of the slag pile investigation and the statistical analysis indicate that further sampling would be needed to statistically characterize the slag pile. If these additional samples indicate the slag pile to constitute hazardous waste, then a Remedial Investigation/ Feasibility Study (RI/FS) will be needed to evaluate the viable remedial alternatives and select the most appropriate alternative(s). Some of the potential alternatives include:

- Remove the contents of the slag pile as hazardous material to an appropriate disposal facility under the observation of qualified hazardous materials professionals and asbestos trained personnel;

- Contain the contents of the pile on-site; or

- Chemically treat the slag pile and transport to an appropriate disposal facility or leave it on-site.

The above is not a complete list and only serves as an example of some available alternatives.

Characterization of the ground water beneath the site is based on one round of laboratory samples only. We recommend that a minimum of one more round of salmples be obtained and chemically tested to confirm the presence of the contaminants in the ground water, as discussed previously.

-o0o-

Dames & Moore appreciates the opportunity to assist you on this project. We trust that this report meets your current requirements. Please contact us if you have any questions regarding this report or require additional information.

Subject: Re: Site Reassessment

Al,

I could only find the Griffin Wheel site on Geotracker. I could not find any of the other two sites that you say that EPA has are Regional Board Lead sites. I couldn't find the two sites on Envirostor either, so I do not know anything about them. The Griffin Wheel site was closed on 7/22/1994. There is a closure letter that you can download from Geotracker. The site is under the Groundwater Cleanup Program and not under the UST program, so I would contact Ann Sturdivant, Supervisor of our GCP, for more info on the site since I only know what I can read in Geotracker.

Sorry Carl to bother you again, Greg Holmes a sign me some of a site reassessment he got it from EPA. Three of them in your area and the Water Board should be the lead agency for them. Could you please help me on this subject specially on the latest information or recent action has been taken and if the sites has been closed. Thanks.

Category 1
Category 1 includes most leaking underground fuel tank (LUFT) sites and many small commercial facilities, such as dry cleaners. Category 1 sites are characterized by soil or groundwater contamination that does not pose an immediate human health threat and does not extend off-site onto neighboring properties. Off-site groundwater plumes that extend only into the public right of way are also included in this category. We expect little or no public interest at Category 1 sites.

Category 2
Category 2 includes larger industrial or commercial sites with significant soil and groundwater contamination. At these sites, the groundwater plume extends off-site beyond the public right of way (or is assumed to extend off-site until investigation shows otherwise). This category includes many solvent sites. A few LUFT sites will fall into this category.
This category also includes:

- sites where moderate public concern or interest exists (or is anticipated)
- RCRA analogous sites, where we have agreed to follow an oversight process that's equivalent to the RCRA corrective action program CLRRA sites, where a buyer or landowner has applied for liability relief pursuant to this Brownfield legislation

Category 3
Category 3 includes federal Superfund sites and other large or complex contamination sites. These sites have significant soil and groundwater contamination and/or threaten human health. Contamination from these sites may be significantly impacting existing or future land uses, groundwater users, or ecological receptors, or is perceived as such. These sites may also be the focus of other sensitive issues such as a change in land use. There may be significant public interest in Category 3 sites.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105

AUG 2 2 2013

Scott Cantonwine
President/CEO
Cascade Warehouse Company, Inc.
1330 Salem Industrial Dr. NE
Salem, OR 97301

RE: Griffin Wheel Dump
EPA ID #: CAD983633744

Dear Mr. Cantonwine:

Enclosed is a Site Reassessment report of the Griffin Wheel Dump site. This report contains the results of an evaluation conducted by Weston Solutions, Inc. for the U.S. Environmental Protection Agency (EPA) under Section 104 of the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended [42 U.S.C. 9404], commonly known as Superfund. The purpose of the Site Reassessment is to determine whether this site may qualify for placement on the National Priorities List (NPL).

Based on currently available information contained in the enclosed report, EPA has determined that, although the site qualifies for further investigation under CERCLA, this site is of no further federal interest due to the completion of the on-site remediation under the oversight of the California Regional Water Quality Control Board (RWQCB) and issuance of site closure approval by the RWQCB in 1993. EPA has no plans to propose this site to the NPL. If you have any questions or comments, please contact Leslie Ramirez at 415-972-3978 or at ramirez.leslie@epa.gov.

Sincerely,

Deborah Schechter, Chief
Brownfields and Site Assessment Section
Superfund Division

Enclosure

REMEDIAL SITE ASSESSMENT DECISION - EPA REGION IX

SFUND RECORDS CTR
2366575

EPA ID: CAD983633744 **Site Name:** GRIFFIN WHEEL DUMP **State ID:**

Alias Site Names:

City: COLTON

Refer to Report Dated: **County or Parish:** SAN BERNARDINO **State:** CA

Report Developed By: **Report Type:** PRELIMINARY ASSESSMENT 001

[X] **1. Further Remedial Site Assessment Under CERCLA (Superfund) is not required because:**

NFRAP-Site does not qualify for the NPL based on existing information

[ ] **2. Further Assessment Needed Under CERCLA:**

Discussion/Rationale:

The Griffin Wheel Dump site ("the site") occupies approximately 26.7 acres and is located in a primarily industrial area at 1280 South Jefferson Lane in Colton, San Bernardino County, California. Historic operations at the site include, but are not limited to: railroad wheel manufacturing from approximately 1957 to 1982; polyethylene pipe manufacturing from 1988 to 2003; and warehousing/distribution activities since approximately 2004. No known operations occurred at the site between 1982 and 1987 or prior to the development of the site in 1957. The site is currently occupied by the Cascade Warehouse Company (CWC), a warehousing and distribution facility, and includes a 100,000 square-foot manufacturing/warehouse building.

Between approximately 1957 until 1982, the site was operated as a foundry for railroad wheel manufacturing by the Griffin Wheel Company, a division of Amsted International. During this time, approximately 22,000 cubic yards of solid foundry wastes were stockpiled at the southwestern portion of the site. Foundry wastes deposited in the stockpile reportedly included, but were not necessarily limited to: grinding fines, furnace slag, foundry sands, and baghouse dust. Additional hazardous substances known to have been stored and/or used on site during wheel manufacturing operations include cutting oils and water treatment chemicals such as chromate compounds.

In 1988, Plexco, Inc., a division of Amsted International, began using the site to manufacture polyethylene pipes and polyethylene coatings for metal pipes. The manufacturing process primarily involved receiving dry polyethylene pellets which were subsequently melted, molded, cooled, and cut into piping. With the exception of used transmission gear oil, no hazardous substances are known to have been used and/or stored on site during polyethylene pipe manufacturing. In 1989, the Plexco, Inc. division was sold by Amsted International to the Chevron Chemical Company. In 2000, the Plexco subsidiary was merged into Chevron's newly formed "Performance Pipe" division and continued the polyethylene pipe manufacturing and coatings operations at the site until 2003 when the facility was sold to the CWC.

Between 1987 and 1994, numerous soil and groundwater sampling events have been conducted at the site by former site owners, Amsted International and the Chevron Chemical Company. Soil matrix sampling conducted within the on-site foundry waste stockpile area between approximately 1989 and 1993 identified elevated concentrations of metals including cadmium, hexavalent chromium, lead, and zinc. In 1989, a Phase II Environmental Site Assessment was completed by the Chevron Chemical Company to further characterize the solid waste in the foundry waste stockpile. As part of the investigation three monitoring wells (MW-1 through MW-3) were installed and sampled. In addition, soil borings were advanced within, and adjacent to, the waste stockpile. Groundwater samples were analyzed for metals and VOCs. Analytical results indicated the Maximum Contaminant Level (MCL) was exceeded in one or more of the groundwater samples for arsenic, barium, cadmium, and lead. However, the validity of the metal analysis results has been questioned because the samples were not filtered prior to analysis as required by EPA sampling protocols. The groundwater samples also exhibited slightly elevated concentrations of TCE and PCE. Starting in 1990, the sampling work was conducted under the guidance of the California Regional Water Quality Control Board (RWQCB). The waste stockpile has since been remediated and rendered inert by stabilization, subsequently leading to formal closure of the disposal area. The closure report was approved by the RWQCB in July 1993. No known soil or groundwater sampling has been conducted at the site since June 1994.

A Preliminary Assessment (PA) was completed for the site on April 2, 1993. Based upon this PA, the site was recommended as a higher priority for further assessment. A non-sampling Site Inspection (SI) was completed for the site on July 14, 1995. Based upon this SI, the site was recommended as a low priority for further assessment due to the

EPA ID: CAD983633744 **Site Name:** GRIFFIN WHEEL DUMP **State ID:**

completion of the on-site remediation under the oversight of the RWQCB and due to the RWQCB having issued site closure approval. CWC primarily uses the site to warehouse and distribute materials such as lumber and plastic pellets by rail and/or truck. No known manufacturing is conducted by CWC on site and no known hazardous substances are used and/or stored on site.

There are no known residences, schools, or daycare facilities located on site. In addition, there are no known sensitive environments onsite and approximately 40 percent of the site is covered by pavement or buildings. The entirety of the site is reportedly enclosed behind a chain-link fence and is not accessible to the public.

EPA has determined that, although the site qualifies for further investigation under CERCLA, this site is of no further federal interest due to the completion of the on-site remediation under the oversight of the RWQCB and issuance of site closure approval by the RWQCB in 1993. EPA has no plans to propose this site to the NPL.

The U.S. Environmental Protection Agency (EPA) has determined that no further remedial action by the Federal Superfund program is warranted at the referenced site, at this time. The basis for the no further remedial action planned (NFRAP) determination is provided in the attached document. A NFRAP designation means that no additional remedial steps under the Federal Superfund program will be taken at the site unless new information warranting further Superfund consideration or conditions not previously known to EPA regarding the site are disclosed. In accordance with EPA's decision regarding the tracking of NFRAP sites, the referenced site may be removed from the CERCLIS database and placed in a separate archival database as a historical record if no further Superfund interest is warranted. Archived sites may be returned to the CERCLIS site inventory if new information necessitating further Superfund consideration is discovered.

Site Decision Made by: LESLIE RAMIREZ

Subject: RE: Records Request

Good morning,

Your file review appointment is confirmed for:

Cooley Ranch Landfill 0276-551-01-0000, 600 Block of Congress Street, Colton 92324 on Tuesday, May 7th at 11am.

You do not have to leave during lunch.

All of Guyaux Landfill files can be found on Geotracker.

Thank you,
File Review Desk

Subject: RE: Records Request

I would like to schedule file review on Tues 5/7 @ 11AM. Do we need to leave during lunch hour? I would like to review the Cooley Ranch Landfill files as well as Guyaux Landfill files, unless you can confirm Guyaux Landfill files are all on Geotracker?

Subject: RE: Records Request

Good afternoon,

After careful review of our records, we show we have files available for review for the following site:
Guyaux Landfill, End of Flores & Fernando Street, Colton, CA 92324

All responsive records for your request can be found on Geotracker using the following link:
https://geotracker.waterboards.ca.gov/profile_report.asp?global_id=T10000006307

We show we have files available for review for the following site:
Cooley Ranch Landfill 0276-551-01-0000, 600 Block of Congress Street, Colton 92324

Please contact us through this inbox if you would like to schedule an appointment to review **Cooley Ranch Landfill** files M-F 8:30-4:30.

Thank you,
File Review Desk

RESPONSE TO REQUEST TO DISCONTINUE ROUTINE GROUNDWATER MONITORING AT COOLEY RANCH LANDFILL

Dear Mr. Rivera:

We have received and reviewed a report prepared by Bryan A. Stirrat & Associates, Inc., and GeoLogic Associates, Inc., dated December 29, 1994. This report, Recommendation to Discontinue Routine Groundwater Monitoring at Cooley Ranch Landfill, contains a summary of historical groundwater monitoring data for the site and requests a discontinuance of quarterly monitoring.

Based upon our review of the groundwater data and the water quality information submitted in the report, we agree that the landfill does not appear to be degrading water quality in its vicinity, nor does it seem likely that it will do so in the future. We therefore approve your request to discontinue groundwater monitoring at the Cooley Ranch landfill. **It will be necessary for the county to continue to perform routine maintenance at the site in order to assure proper drainage and prevent erosion.**

If you have any questions about this letter, please contact me at (909) 782-4991.

Sincerely,

Alison Jones

RE: REQUEST TO DISCONTINUE ROUTINE GROUNDWATER MONITORING AT COOLEY RANCH LANDFILL, SAN BERNARDINO COUNTY, CALIFORNIA

Dear Ms. Lass:

The County of San Bernardino Solid Waste Management Department (SWMD), is formally requesting to discontinue routine groundwater monitoring at the Cooley Ranch Landfill.

This request is based on the contents and recommendations contained in a report submitted to the SWMD by the team of Bryan A. Stirrat (BAS) and GeoLogic Associates, Inc. (GLA). The report presented strong and compelling arguments that suggest the Cooley Ranch Landfill is not contributing significantly to degradation of local water quality. As a case in point, organic compounds have been identified only irregularly and inconsistently and have sporadically been identified in both upgradient and downgradient wells. Also, given the age of the Landfill (i.e., was active only from 1962 - 1965) it is considered unlikely that further monitoring will result in future indications of release.

Enclosed for your review and approval is a copy of the report prepared by the team of BAS and GLA, which also includes all historical groundwater quality data for the site.

I would like to thank you in advance for your prompt review and consideration of our request. Should you have any questions or require additional information please contact me at (909) 386-8775 or Art Rivera at (909) 386-8748.

Sincerely,

Patrick J. Mead

MONITORING WELL DECOMISSIONING REPORTS FOR COOLEY RANCH AND PLUNGE CREEK LANDFILLS, SAN BERNARDINO COUNTY

Dear Mr. Rivera:

We have reviewed the above-referenced reports dated September 16, 2010, which were received on September 20, 2010. These two reports outline the monitoring well destruction and abandonment activities that took place at Cooley Ranch and Plunge Creek Landfills.

Cooley Ranch Landfill

Four groundwater monitoring wells, CR-1 through CR-4, were originally constructed at Cooley Ranch Landfill to monitor the groundwater quality beneath the site. Monitoring well CR-1 was located on a parcel of land that was purchased by American Honda Motor Co., Inc. and developed as an off-road motorcycle course. Monitoring well CR-1 was destroyed in place during the development of the motorcycle course and no longer poses a threat. Monitoring wells CR-2 through CR-4 were abandoned as described in this report.

Plunge Creek Landfill

Eight groundwater monitoring wells, PC-1 through PC-8, were originally constructed at Plunge Creek Landfill to monitor the groundwater quality beneath the site. Monitoring wells PC-1 through PC-4 and PC-6 through PC-8 were abandoned as described in this report. Monitoring well PC-5 was located on a parcel of land that was purchased by a private party and developed as a shopping center. Monitoring well PC-5 is located beneath a reinforced concrete parking lot, and is believed to have been abandoned in place at the time of the parking lot construction.

Based on our review of your reports, we have determined that the wells have been properly abandoned and no longer pose a treat to water quality. Therefore no further action is required at either site. Please be advised that our letter does not relieve you of your responsibility to comply with rules and regulations set forth by other agencies.

If you have any questions, please contact me at (951) 320-2024, or rakhtarshad@waterboards.ca.gov.

Sincerely,

Ray Akhtarshad
WRC Engineer

GBA Geoenvironmental Report

Leighton

Important Information about This

Geoenvironmental Report

Geoenvironmental studies are commissioned to gain information about environmental conditions on and beneath the surface of a site. The more comprehensive the study, the more reliable the assessment is likely to be. But remember: Any such assessment is to a greater or lesser extent based on professional opinions about conditions that cannot be seen or tested. Accordingly, no matter how many data are developed, risks created by unanticipated conditions will always remain. *Have realistic expectations.* Work with your geoenvironmental consultant to manage known and unknown risks. Part of that process should already have been accomplished, through the risk allocation provisions you and your geoenvironmental professional discussed and included in your contract's general terms and conditions. This document is intended to explain some of the concepts that may be included in your agreement, and to pass along information and suggestions to help you manage your risk.

Beware of Change; Keep Your Geoenvironmental Professional Advised

The design of a geoenvironmental study considers a variety of factors that are subject to change. Changes can undermine the applicability of a report's findings, conclusions, and recommendations. *Advise your geoenvironmental professional about any changes you become aware of.* Geoenvironmental professionals cannot accept responsibility or liability for problems that occur because a report fails to consider conditions that did not exist when the study was designed. Ask your geoenvironmental professional about the types of changes you should be particularly alert to. Some of the most common include:

- modification of the proposed development or ownership group,
- sale or other property transfer,
- replacement of or additions to the financing entity,
- amendment of existing regulations or introduction of new ones, or
- changes in the use or condition of adjacent property.

Should you become aware of any change, *do not rely on a geoenvironmental report.* Advise your geoenvironmental professional immediately; follow the professional's advice.

Recognize the Impact of Time

A geoenvironmental professional's findings, recommendations, and conclusions cannot remain valid indefinitely. The more time that passes, the more likely it is that important latent changes will occur. *Do not rely on a geoenvironmental report if too much time has elapsed since it was completed.* Ask your environmental professional to define "too much time." In the case of Phase I Environmental Site Assessments (ESAs), for example, more than 180 days after submission is generally considered "too much."

Prepare To Deal with Unanticipated Conditions

The findings, recommendations, and conclusions of a Phase I ESA report typically are based on a review of historical information, interviews, a site "walkover," and other forms of noninvasive research. When site subsurface conditions are not sampled in any way, the risk of unanticipated conditions is higher than it would otherwise be.

While borings, installation of monitoring wells, and similar invasive test methods can help reduce the risk of unanticipated conditions, *do not overvalue the effectiveness of testing.* Testing provides information about actual conditions only at the precise locations where samples are taken, and only when they are taken. Your geoenvironmental

professional has applied that specific information to develop a general opinion about environmental conditions. *Actual conditions in areas not sampled may differ (sometimes sharply) from those predicted in a report.* For example, a site may contain an unregistered underground storage tank that shows no surface trace of its existence. *Even conditions in areas that were tested can change*, sometimes suddenly, due to any number of events, not the least of which include occurrences at adjacent sites. Recognize, too, that *even some conditions in tested areas may go undiscovered,* because the tests or analytical methods used were designed to detect only those conditions assumed to exist.

Manage your risks by retaining your geoenvironmental professional to work with you as the project proceeds. Establish a contingency fund or other means to enable your geoenvironmental professional to respond rapidly, in order to limit the impact of unforeseen conditions. And to help prevent any misunderstanding, identify those empowered to authorize changes and the administrative procedures that should be followed.

Do Not Permit Any Other Party To Rely on the Report

Geoenvironmental professionals design their studies and prepare their reports to meet the specific needs of the clients who retain them, in light of the risk management methods that the client and geoenvironmental professional agree to, and the statutory, regulatory, or other requirements that apply. The study designed for a developer may differ sharply from one designed for a lender, insurer, public agency...or even another developer. *Unless the report specifically states otherwise, it was developed for you and only you.* Do not unilaterally permit any other party to rely on it. The report and the study underlying it may not be adequate for another party's needs, and you could be held liable for shortcomings your geoenvironmental professional was powerless to prevent or anticipate. Inform your geoenvironmental professional when you know or expect that someone else—a third-party—will want to use or rely on the report. *Do not permit third-party use or reliance until you first confer with the geoenvironmental professional who prepared the report.* Additional testing, analysis, or study may be required and, in any event, appropriate terms and conditions should be agreed to so both you and your geoenvironmental professional are protected from third-party risks. *Any party who relies on a geoenvironmental report without the express written permission of the professional who prepared it and the client for whom it was prepared may be solely liable for any problems that arise.*

Avoid Misinterpretation of the Report

Design professionals and other parties may want to rely on the report in developing plans and specifications. They need to be advised, in writing, that their needs may not have been considered when the study's scope was developed, and, even if their needs were considered, they might misinterpret geoenvironmental findings, conclusions, and recommendations. *Commission your geoenvironmental professional to explain pertinent elements of the report to others who are permitted to rely on it, and to review any plans, specifications or other instruments of professional service that incorporate any of the report's findings, conclusions, or recommendations.* Your geoenvironmental professional has the best understanding of the issues involved, including the fundamental assumptions that underpinned the study's scope.

Give Contractors Access to the Report

Reduce the risk of delays, claims, and disputes by giving contractors access to the full report, *providing that it is accompanied by a letter of transmittal that can protect you* by making it unquestionably clear that: 1) the study was not conducted and the report was not prepared for purposes of bid development, and 2) the findings, conclusions, and recommendations included in the report are based on a variety of opinions, inferences, and assumptions and are subject to interpretation. Use the letter to also advise contractors to consult with your geoenvironmental professional to obtain clarifications, interpretations, and guidance (a fee may be required for this service), and that—in any event—they should conduct additional studies to obtain the specific type and extent of information each prefers for preparing a bid or cost estimate. Providing access to the full report, with the appropriate caveats, helps prevent formation of adversarial attitudes and claims of concealed or differing conditions. If a contractor elects to ignore the warnings and advice in the letter of transmittal, it would do so at its own risk. Your geoenvironmental professional should be able to help you prepare an effective letter.

Do Not Separate Documentation from the Report

Geoenvironmental reports often include supplemental documentation, such as maps and copies of regulatory files, permits, registrations, citations, and correspondence with regulatory agencies. If subsurface explorations were performed, the report may contain final boring logs and copies of laboratory data. If remediation activities occurred on site, the report may include: copies of daily field reports; waste manifests; and information about the disturbance of subsurface materials, the type and thickness of any fill placed on site, and fill placement practices, among other types of documentation. *Do not separate supplemental documentation from the report. Do not, and do not permit any other party to redraw or modify any of the supplemental documentation for incorporation into other professionals' instruments of service.*

Understand the Role of Standards

Unless they are incorporated into statutes or regulations, standard practices and standard guides developed by the American Society for Testing and Materials (ASTM) and other recognized standards-developing organizations (SDOs) are little more than aspirational methods agreed to by a consensus of a committee. The committees that develop standards may not comprise those best-qualified to establish methods and, no matter what, no standard method can possibly consider the infinite client- and project-specific variables that fly in the face of the theoretical "standard conditions" to which standard practices and standard guides apply. In fact, these variables can be so pronounced that geoenvironmental professionals who comply with every directive of an ASTM or other standard procedure could run afoul of local custom and practice, thus violating the standard of care. Accordingly, when geoenvironmental professionals indicate in their reports that they have performed a service "in general compliance" with one standard or another, it means they have applied professional judgement in creating and implementing a scope of service designed for the specific client and project involved, and which follows some of the general precepts laid out in the referenced standard. To the extent that a report indicates "general compliance" with a standard, you may wish to speak with your geoenvironmental professional to learn more about what was and was not done. *Do not assume a given standard was followed to the letter.* Research indicates that that seldom is the case.

Realize That Recommendations May Not Be Final

The technical recommendations included in a geoenvironmental report are based on assumptions about actual conditions, and so are preliminary or tentative. Final recommendations can be prepared only by observing actual conditions as they are exposed. For that reason, you should retain the geoenvironmental professional of record to observe construction and/or remediation activities on site, to permit rapid response to unanticipated conditions. *The geoenvironmental professional who prepared the report cannot assume responsibility or liability for the report's recommendations if that professional is not retained to observe relevant site operations.*

Understand That Geotechnical Issues Have Not Been Addressed

Unless geotechnical engineering was specifically included in the scope of professional service, a report is not likely to relate any findings, conclusions, or recommendations about the suitability of subsurface materials for construction purposes, especially when site remediation has been accomplished through the removal, replacement, encapsulation, or chemical treatment of on-site soils. The equipment, techniques, and testing used by geotechnical engineers differ markedly from those used by geoenvironmental professionals; their education, training, and experience are also significantly different. If you plan to build on the subject site, but have not yet had a geotechnical engineering study conducted, your geoenvironmental professional should be able to provide guidance about the next steps you should take. The same firm may provide the services you need.

Read Responsibility Provisions Closely

Geoenvironmental studies cannot be exact; they are based on professional judgement and opinion. Nonetheless, some clients, contractors, and others assume geoenvironmental reports are or certainly should be unerringly precise. Such assumptions have created unrealistic expectations that have led to wholly unwarranted claims and disputes. To help prevent such problems, geoenvironmental professionals have developed a number of report provisions and contract terms that explain who is responsible for what, and how risks are to be allocated. Some people mistake these for "exculpatory clauses," that is, provisions whose purpose is to transfer one party's rightful responsibilities and liabilities to someone else. Read the responsibility provisions included in a report and in the contract you and your geoenvironmental professional agreed to. *Responsibility provisions are not "boilerplate."* They are important.

Rely on Your Geoenvironmental Professional for Additional Assistance

Membership in the Geoprofessional Business Association exposes geoenvironmental professionals to a wide array of risk management techniques that can be of genuine benefit for everyone involved with a geoenvironmental project. Confer with your GBA-member geoenvironmental professional for more information.

MAR 19 1997

Mr. Ralph Guyuax
16955 Washington Street
Riverside, CA 92504

Re: Guyuax Landfill
CAD 983652033

Dear Mr. Guyuax:

Enclosed find the report of a recent evaluation of the Guyuax Landfill conducted by the U.S. Environmental Protection Agency. This evaluation was conducted under the authority of Section 104 of the Comprehensive Environmental Response, Compensation, and Liability Act, as amended, 40 U.S.C. § 9604, commonly known as Superfund.

The results of our groundwater sampling show that concentrations of hazardous substances detected in the groundwater wells downgradient of the landfill were not significantly (more than three times) greater than what was found in groundwater wells upgradient from the landfill. For this reason, this site does not qualify for listing on the federal Superfund [National Priorities] List. However, the results of our soil sampling indicate that hazardous substances including arsenic, cadmium, chromium, lead, manganese, mercury and toluene are present at concentrations significantly above background levels. Since the landfill is not secured from public access and the soil is uncovered, there is a potential of exposing the public to the contaminants.

We have discussed the conditions at the landfill with California Department of Toxic Substances Control. They will be the lead regulatory agency for you to work with as you further investigate the hazardous conditions at the landfill. Upon the request of DTSC, we will provide technical assistance in selecting options for investigating and remediating the landfill.

An EPA Region IX remedial site assessment decision record is included at the end of the report.

Dear Mr. Zamora:

During a recent telephone conversation, you requested information regarding the Guyaux Landfill site in Colton, Calif. (CAD 983652033). In response to your request, Gordon Woodrow, Site Assessment Manager at the U.S. Environmental Protection Agency (EPA), Region IX, directed me to send you a copy of the Site Inspection Report for the site (see enclosure). If you have any questions you may contact me at (415) 768-6496.

Sincerely Yours,

Gregory R. Carroll

Bechtel Environmental, Inc.

1.0 INTRODUCTION

The U.S. Environmental Protection Agency (EPA), Region IX, under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA), has tasked Bechtel Environmental, Inc. (BEI) to conduct a site inspection (SI) of the Guyaux Landfill site in Colton, San Bernardino County, Calif.

The Guyaux Landfill site was identified as a potential hazardous waste site and entered into the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) on December 9, 1992 (CAD 983652033). (1) The site was entered into CERCLIS based on the Potential Hazardous Waste Site Identification Form submitted by Roy F. Weston, Inc. to the EPA (2).

A preliminary assessment (PA) of the Guyaux Landfill was completed for the EPA by Roy F. Weston, Inc. on June 10, 1993 (1,2). The purpose of the PA was to review existing information on the site and its environs to assess the threat(s), if any, posed to public health, welfare, or the environment, and to determine if further action under CERCLA/SARA is warranted.

After reviewing the PA, the EPA decided that further investigation of the Guyaux Landfill site would be necessary to more completely evaluate the site using the EPA's Hazard Ranking System (HRS) criteria. The HRS assesses the relative threat associated with actual or potential releases of hazardous substances at the site. The HRS has been adopted by the EPA to help set priorities for further evaluation and eventual remedial action at hazardous waste sites. The HRS is the primary method of determining a site's eligibility for placement on the National Priorities List (NPL). The NPL identifies sites at which the EPA may conduct remedial response actions. This report summarizes the results of the SI of the Guyaux Landfill site.

1.1 Apparent Problem

The apparent problems at the site are as follows:

- In the 1970s and 1980s, waste slag generated at the Griffin Wheel Company site was deposited at Guyaux Landfill. Results of laboratory analyses of the waste slag samples indicated the presence of elevated concentrations of inorganics including arsenic, cadmium, and lead. (3,4)
- Results of laboratory analyses of groundwater samples collected from an agricultural well, downgradient of the site and screened in the drinking-water aquifer, indicated the presence of arsenic at concentrations significantly greater than background levels. (5)

Printed on 50% recycled paper.

2.0 SITE DESCRIPTION

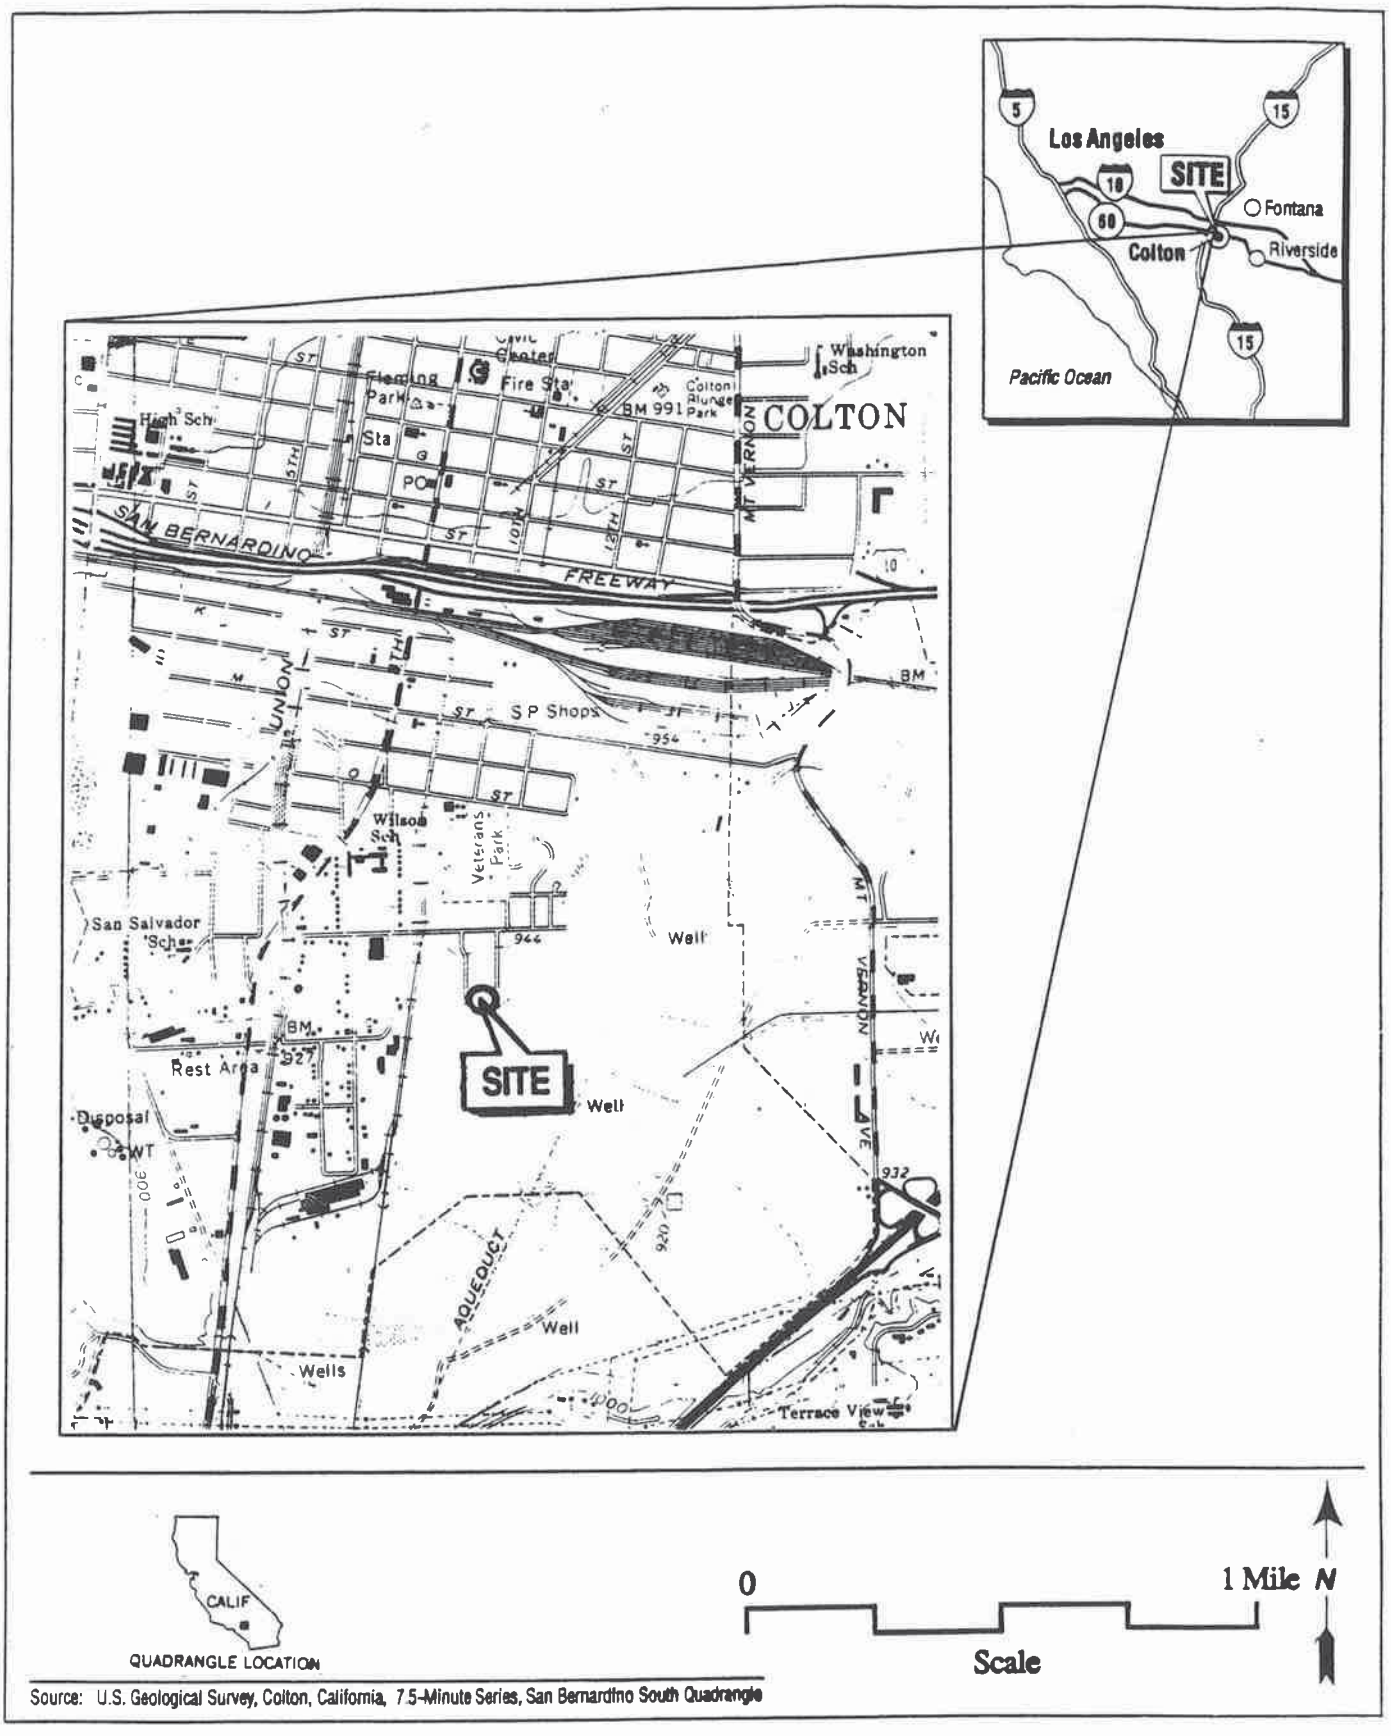
2.1 Location

The Guyaux Landfill site is located at the end of Florez and Fernando streets in Colton, San Bernardino County, Calif. The geographic coordinates for the site are 34° 03' 11.50" N latitude, 117° 19' 15.50" W longitude (Township 1 South, Range 4 West, San Bernardino Baseline and Meridian, San Bernardino South, Calif., 7.5-minute quadrangle) (6). The location of the site is shown in Figure 2-1.

2.2 Site Description

The Guyaux Landfill site is located in an industrial/residential area of Colton, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by vacant land and the Santa Ana River. (7) The site layout is shown in Figure 2-2.

The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill sometime between 1930 and 1985. The rest of the site is in a floodplain. The elevation of the former landfill is approximately 15 feet higher than the rest of the site. The entire site is unpaved, unfenced, and covered by vegetation. (7)



2.3 Operational History

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994. Ralph Guyaux acquired title to the property in July 1994. (7)

Since 1930, [illegible]cres of the site have been used as a landfill. In the 1930s, construction debris from the rebuildi[illegible]f the City of Colton were disposed of in the landfill portion of the site. In the 1950s, the la[illegible]ill was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s and 1980s, the landfill was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company sites. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited on the landfill. In addition, the landfill accepted waste slag from the Griffin Wheel Company. Since 1985, the landfill portion of the site has been used for the temporary storage of cars and machinery prior to dismantling and reuse. (7)

At the time of the site visit, piles of waste slag were noted along the face and on top of the landfill. Several piles of used tires and pieces of old furniture were also dumped on site. In addition, up to 10 empty 55-gallon drums were on site. (7)

Printed on 50% recycled paper.

Source: U.S. Geological Survey, Colton, California, 7.5-Minute Series, San Bernardino South Quadrangle

Figure 2-1 Site Location

Printed on 50% recycled paper.

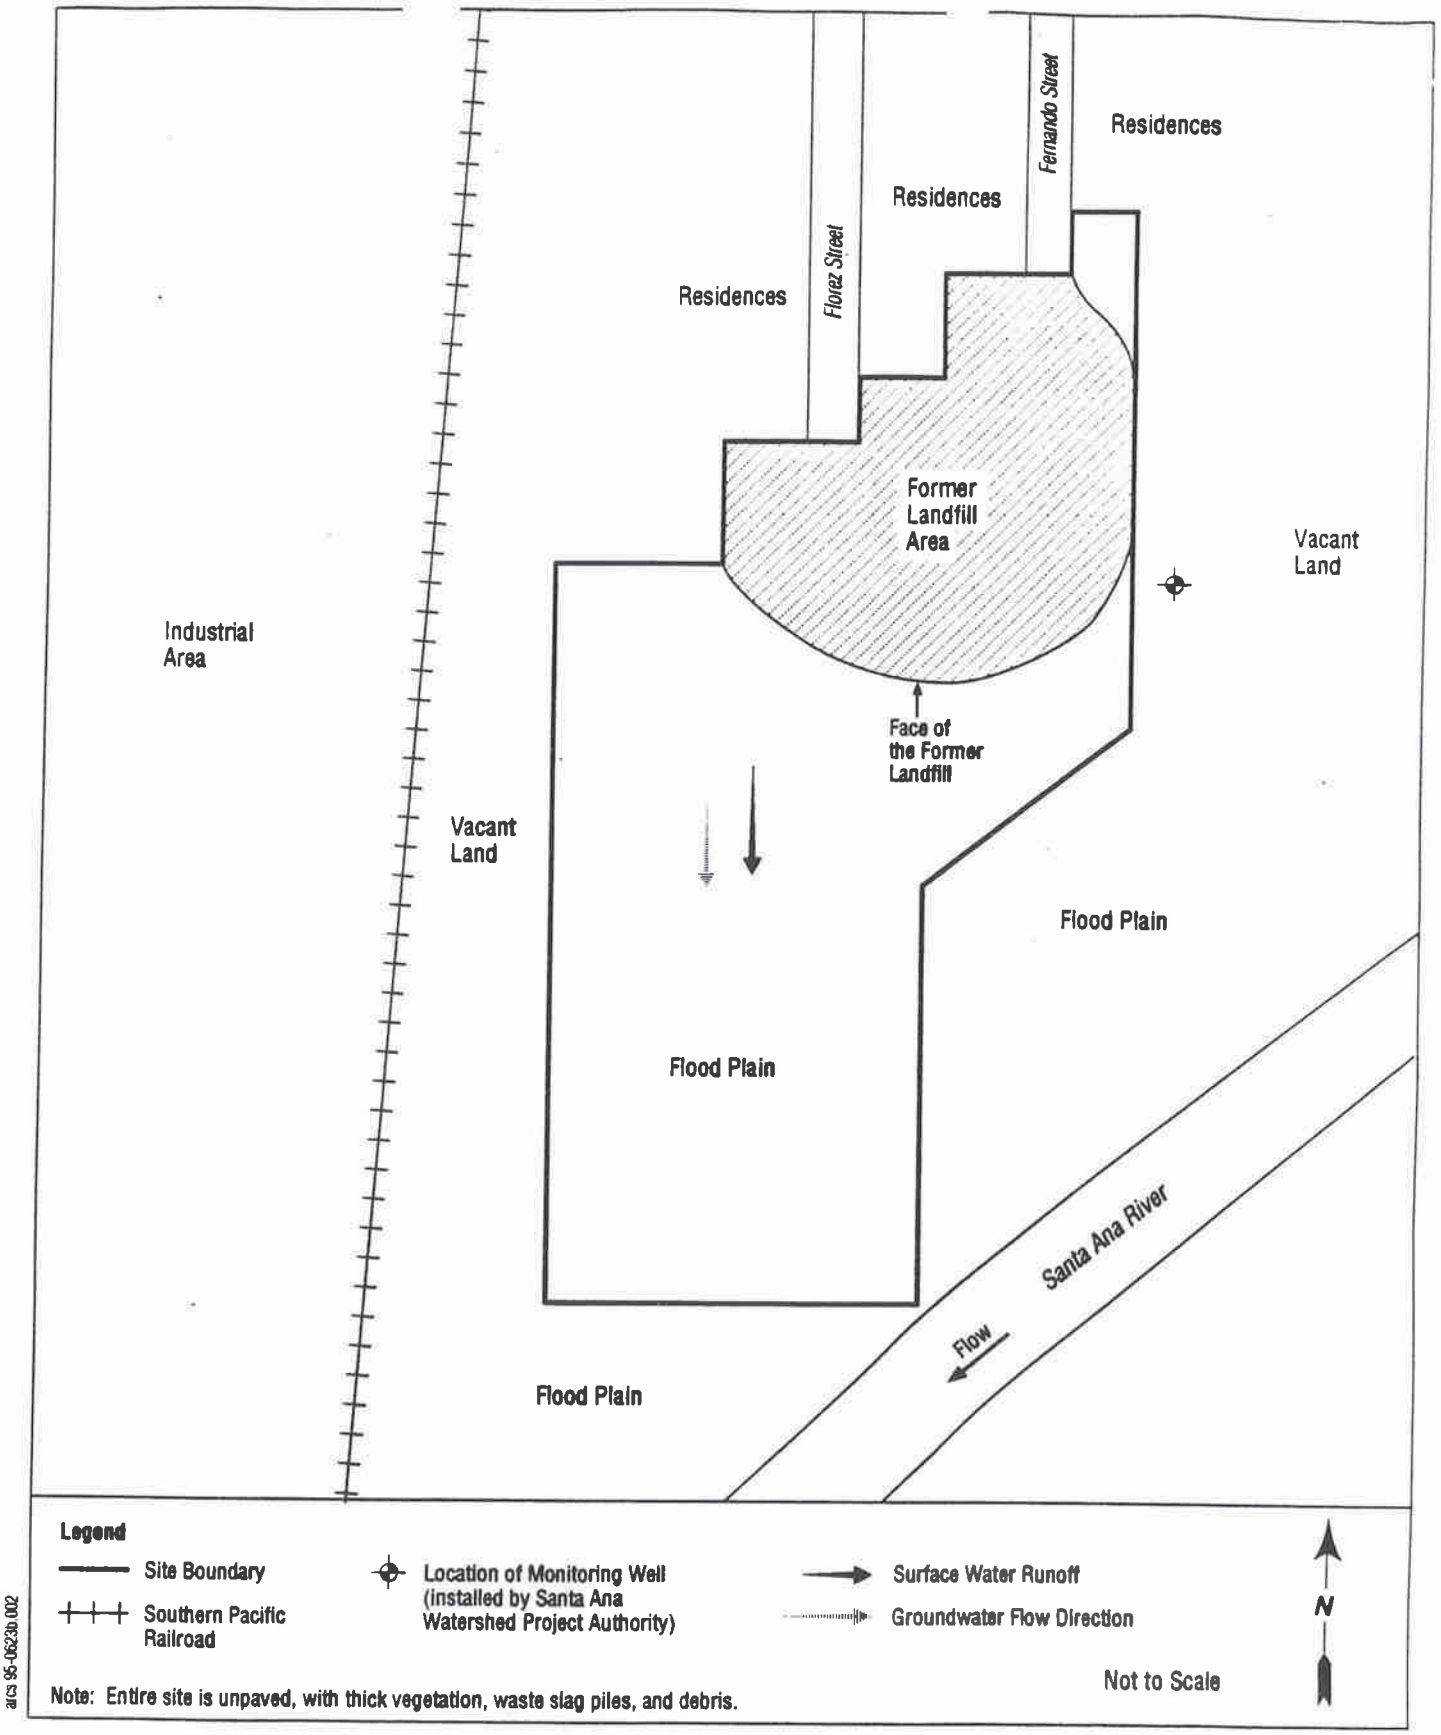


Figure 2-2 Site Layout

2.4 Regulatory Involvement

2.4.1 U.S. Environmental Protection Agency (EPA). The Guyaux Landfill site is not listed in the Resource Conservation and Recovery Information System (RCRIS) database, as of November 22, 1994 (8).

2.4.2 California Environmental Protection Agency.

Regional Water Quality Control Board (RWQCB), Santa Ana Region. The RWQCB has been involved with the site since 1977. In response to a citizen complaint in 1977, the RWQCB requested that the site owner submit a report of waste discharge (ROWD). In response, an incomplete ROWD was submitted by the site owner to the RWQCB. In 1981, the RWQCB requested that the site owner sample and analyze the waste slag. The site owner did not comply with this request. In 1985, the RWQCB requested a groundwater monitoring network around the site. The site owner did not comply with this request. In 1988, the RWQCB requested a Solid Waste Assessment Test (SWAT) from the site owner. The site owner has not responded to this request. (3)

3.0 INVESTIGATIVE EFFORTS

3.1 Previous Sampling and Analyses

3.1.1 Waste Slag Sampling. Waste slag generated at the Griffin Wheel Company was deposited at the Guyaux Landfill site. In 1989, Dames & Moore, contractors to the Griffin Wheel Company conducted a Phase II site assessment at the Griffin site to characterize the waste slag. Eleven soil borings were drilled in the slag pile during this investigation. The slag samples were analyzed for California Code of Regulations Title 22 metals. Results of laboratory analyses of the samples indicated the presence of Title 22 metals, including up to 105 milligrams per kilogram (mg/kg) of arsenic, 72.1 mg/kg of cadmium, and 9,520 mg/kg of lead. (4)

3.1.2 Groundwater Sampling. In 1989, the Santa Ana Watershed Project Authority (SAWPA) conducted a regional hydrogeological study in the vicinity of the site. As part of this study, monitoring wells screened in a shallow perched groundwater zone (approximately 40 feet to 80 feet below ground surface) were installed. Groundwater samples collected from a downgradient monitoring well (A-2) were analyzed for metals. Information on the analytical methods used are not available. Results of laboratory analyses indicated the presence of inorganics including arsenic at 18 parts per billion (ppb) and barium at 69 ppb. (9)

In 1993 and 1994, the City of Riverside sampled the agricultural wells in the vicinity of the site. Groundwater samples collected from an agricultural well (Flume 6) downgradient of the site and screened in the drinking-water aquifer were analyzed for metals using EPA Method 6010. Results of laboratory analyses of the groundwater samples indicated the presence of up to 15 ppb of arsenic. A background agricultural well (Flume 2) also screened in the drinking-water aquifer did not contain arsenic above its method detection limit. (5)

3.2 EPA Sampling

No EPA-sponsored sampling has been conducted at this site.

4.0 HAZARD RANKING SYSTEM FACTORS

4.1 Sources of Contamination

Historically, waste slag generated at the Griffin Wheel Company was deposited at the Guyaux Landfill. Results of laboratory analyses of the waste slag have indicated the presence of elevated concentrations of inorganics including arsenic, cadmium, and lead. (4,7)

4.2 Groundwater Pathway

4.2.1 Hydrogeological Setting The San Bernardino Valley/Upper Santa Ana Valley area is an alluvial plain. It is bounded on the northwest by the San Gabriel Mountains, on the northeast and east by the San Bernardino Mountains, on the southeast by the San Timeteo Badlands, and on the south by the Box Springs Mountains and the Jurupa Mountains. To the west, the area is bordered by the northern Santa Ana Mountains and the San Gabriel Valley. (4)

The Guyaux Landfill site is located partially within the Santa Ana River floodplain. Municipal drinking-water wells in the vicinity of the site pump groundwater from depths that range from 150 feet to 800 feet below ground surface (bgs) (10). Depth to the groundwater in the vicinity of the site is approximately 40 feet bgs (9). Groundwater flow direction in the vicinity of the site is to the south. Shallow subsurface soils beneath the site consist predominantly of silts and sands. (4,7) The 2-year, 24-hour rainfall event for this area is 2.5 inches (11).

4.2.2 Groundwater Targets. Three drinking-water systems operate municipal drinking-water wells within 4 miles of the site. Forty-nine wells are within 4 miles of the site. The drinking-water systems together serve approximately 283,000 people. The nearest drinking-water well is approximately 0.5 mile northeast of the site. (12,13,14,15)

The City of Riverside obtains almost 100 percent of its drinking water from 48 active groundwater wells that serve approximately 242,000 people. Water from the wells occasionally may be blended with surface water from a single connection maintained by the Metropolitan Water District. Twenty-nine wells are within 4 miles of the site. (12)

The City of Colton obtains 100 percent of its drinking water from 15 active drinking-water wells. The water from these wells is not blended with surface water and is distributed to 8,720 connections. There are approximately 3.1 persons per household for the City of Colton. Fifteen wells are within 4 miles of the site. (13,14)

The Riverside Highland Water Co. obtains 100 percent of its drinking water from 16 active groundwater wells. The blended system serves approximately 14,000 people. Five wells are within 4 miles of the site. (15)

*4.2.3 **Groundwater Pathway Conclusion**.* Results of laboratory analyses of groundwater samples collected from an agricultural well downgradient of the site and screened in the drinking-water aquifer indicates the presence of arsenic at 15 ppb. An upgradient agricultural well also screened in the drinking-water aquifer did not contain arsenic above its method detection limit. (5) Municipal drinking-water wells in the vicinity of the site are screened at depths ranging from 150 feet to 800 feet bgs (10). Three drinking-water systems operate 49 municipal drinking-water wells within 4 miles of the site. These drinking-water systems serve approximately 283,000 people. The nearest drinking-water well is approximately 0.5 mile from the site. (12,13,14,15)

4.3 Surface Water Pathway

Surface water runoff from the site enters the Santa Ana River. The Santa Ana River borders the site on the southeast and flows to the southwest into the Pacific Ocean, approximately 40 miles from the site. (7) There are no drinking-water intakes along the surface water bodies within 15 miles downstream of the site. Although there are fisheries and sensitive environments within 15 miles downstream of the site, none is in the vicinity of the site (16).

4.4 Soil Exposure and Air Pathway

The site is a vacant area covered with vegetation. Piles of waste slag are on the face and the top of the landfill on site. Analytical results of the waste slag indicate the presence of elevated concentrations of inorganics. Although the site is unfenced, there are no residences, schools, or daycare centers on site. (7)

5.0 EMERGENCY RESPONSE CONSIDERATIONS

The National Contingency Plan [40 CFR 300.415 (b) (2)] authorizes the EPA to consider emergency response actions at sites that pose an imminent threat to human health or the environment. For the following reasons, a referral to Region IX's Emergency Response Section does not appear to be necessary:

- No hazardous substances are generated on site.
- No residences, schools, or daycare centers are on site.

6.0 SUMMARY

The Guyaux Landfill site is located in an industrial/residential area of Colton, San Bernardino County, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by the Santa Ana River. The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill sometime between 1930 and 1985. The entire site is unpaved, unfenced, and covered by vegetation and/or waste materials.

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994. Ralph Guyaux acquired title to the property in July 1994.

Since 1930, 6 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton were disposed of on this portion of the site. In the 1950s, the site was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s and 1980s, the site was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited on site. In addition, piles of waste slag from the Griffin Wheel Company were deposited on site. Since 1985, the site has been used for the temporary storage of cars and machinery prior to dismantling and reuse. Currently, piles of waste slag are along the face and on top of the landfill. In addition, several piles of used tires and pieces of old furniture are on site.

The California Environmental Protection Agency, Regional Water Quality Control Board (RWQCB), Santa Ana Region, has been involved with the site since 1977. The RWQCB has requested that the site owner conduct site-specific soil and groundwater sa. ling events. The site owner has not complied with these requests.

Three drinking-water systems operate 49 municipal drinking-water wells within 4 miles of the site. These drinking-water systems together serve approximately 283,000 people. The top of the drinking-water aquifer in the vicinity of the site is approximately 150 feet below ground surface. Depth to the groundwater in the vicinity of the site is approximately 40 feet. Groundwater flow direction in the vicinity of the site is to the south. Shallow subsurface soils beneath the site consist predominantly of silts and sands. Surface water runoff from the site enters the Santa Ana River that flows in a southwesterly direction into the Pacific Ocean, approximately 40 miles from the site. There are no drinking-water intakes along the surface water bodies within 15 miles downstream of the site. Although there are fisheries and sensitive environments within 15 miles downstream of the site, none is in the vicinity of the site. The site is covered by vegetation and/or waste materials. No residences, schools, or daycare centers are on site, and the site is unfenced.

The following pertinent Hazard Ranking System factors are associated with the site:

- Waste slag from the Griffin Wheel Company has been disposed of at the Guyaux Landfill site. Analytical results of the waste slag have indicated the presence of elevated concentrations of arsenic, lead, and cadmium.
- Analytical results of groundwater samples collected from the drinking-water aquifer downgradient of the site have indicated the presence of arsenic at concentrations signficantly greater than background levels.
- Three drinking-water systems operate 49 municipal drinking-water wells within 4 miles of the site. These drinking-water systems together serve approximately 283,000 people.

REMEDIAL SITE ASSESSMENT DECISION - EPA REGION IX

Site Name: GUYAUX LANDFILL **EPA ID#:** CAD 983652033

Alias Site Names:

City: COLTON **County or Parish:** SAN BERNARDINO **State:** CA

Refer to Report Dated: 5/15/95 **Report type:** SITE INSPECTION

Report developed by: Bechtel Environmental, Inc.

DECISION:

| | 1. Further Remedial Site Assessment under CERCLA (Superfund) is not required because:

| | 1a. Site does not qualify for further remedial site assessment under CERCLA (Site Evaluation Accomplished - SEA)

| | 1b. Site may qualify for further action, but is deferred to: | | RCRA | | NRC

|N| 2. Further Assessment Needed Under CERCLA:

2a. (optional) Priority: | | Higher |N| Lower

2b. Activity Type: | | PA |N| ESI | | SI | | HRS evaluation

Bill Norton	RWQCB	(909) 782-4381	1/20/95	Mr. Norton has been involved with the site. The RWQCB will be issuing a Cleanup and Abatement Order to Ralph Guyaux. As part of site investigations conducted at other sites in the vicinity of the Guyaux Landfill, monitoring wells have been installed and groundwater sampling and analyses have been conducted. I can have access to the reports on the site. I faxed him a copy of the site visit letter.
Julie Johnson	DTSC	(310) 590-4980	1/24/95	The DTSC has no files on the site.
Bill Norton	RWQCB	(909) 782-4381	1/24/95	Mr. Norton stated that Ruth Zandbergen owned the property until last year, when Ralph Guyaux gained possession of the property. He is not aware of any soil or groundwater sampling and analyses conducted on site.
Jim Quint	EPA	(415) 744-2331	2/7/95	Mr. Quint asked me to call Susan Carr, a concerned citizen, and inform her about BEI's evaluation of the Guyaux Landfill.
Susan Carr	Concerned Citizen	(909) 370-2414	2/7/95	Ms. Carr expressed concern about the landfill site. She wanted a copy of the final report mailed to Carmen Kruger 940 Florez St., Colton, CA 92324.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Bill Norton	RWQCB	(909) 782-4381	2/8/95	Mr. Norton stated that monitoring well A-2, hydraulically downgradient of the site, is abandoned and has not been sampled for several years. He asked me to contact Eugene Mcmenas at the Riverside Highland Water Company (909) 825-4128 for more information on hydrogeological investigations in the vicinity of the site.
Eugene Mcmenas	Riverside Highland Water Company	(909) 825-4128	2/9/95	Mr. Mcmenas stated that Lee Slate or Bernie Cavanaugh of the Santa Ana Watershed Project Authority (SAWPA) at (909) 785-5411 were directly involved with the regional hydrogeological study.
Lee Slate	Santa Ana Watershed Project Authority (SAWPA)	(909) 785-5411	2/9/95	Left a message.
Lee Slate	SAWPA	(909) 785-5411	2/10/95	Mr. Slate stated that there have been no additional sampling events conducted in the SAWPA wells in the vicinity of the site since 1989. Only two of the wells still existed and can be sampled.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Lee Slate	SAWPA	(909) 785-5411	2/14/95	The only wells that can be sampled in the vicinity of the site are A-1 and MW-5. The remaining wells have been abandoned. The soil type between the shallow perched zone and the drinking-water aquifer is granular, indicating that the two zones are interconnected.
Lee Slate	SAWPA	(909) 785-5411	2/21/95	Mr. Slate has requested that the laboratory provide him with copies of the raw data pertaining to the SAWPA sampling conducted in 1989.
Lee Slate	SAWPA	(909) 785-5411	3/3/95	Mr. Slate has no additional data to provide on the September 1989 sampling event. Well A-2, downgradient of the site, cannot be traced and appears to be abandoned. No drinking-water intakes that originate in the Santa Ana River. Fisheries and sensitive environments may have habitat in Santa Ana River. However, these targets are unlikely to be in the vicinity of the site.
Dan Randall	City of Riverside	(909) 782-5427	3/15/95	None of the City of Riverside municipal drinking-water wells have been closed due contamination attributable to the Guyaux Landfill site. Municipal wells within 4 miles of the site are screened at depths ranging from 150 to 800 feet bgs.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Bill Norton	RWQCB	(909) 782-4381	3/17/95	The shallow perched groundwater zone is not considered to be an aquifer from an economic standpoint. A perched groundwater zone is considered crictical from an environmental standpoint, since it is a source of evaluating groundwater quality in the drinking-water aquifer beneath it.
Rich Haubert	Riverside Highland Water Company	(909) 825-4128	3/21/95	Mr. Haubert stated that the groundwater flow direction on both sides of the river is the same (to the south). The Santa Ana River neither acts as a discontinuity or barrier to the groundwater flow, nor does it influence the depth to the drinking-water aquifer in any way. The depth to the drinking-water aquifer on either side of the river is approximately 150 feet bgs.
Jack Rowles	City of Riverside	(909) 351-6379	3/21/95 & 4/19/95	The City of Riverside maintains four agricultural wells on the west bank of the Santa Ana River. Mr. Rowles will fax me a copy of the well logs. All the agricultural wells are screened at approximately the same depth intervals. In particular, well flume 6 and well flume 2 are screened starting at approximately 150 feet bgs.

Printed on 50% recycled paper.

APPENDIX D

CONTACT REPORT

AGENCY/AFFILIATION: Riverside City Water		CODE:
DEPARTMENT:		
ADDRESS: 3900 Main St.	CITY: Riverside	
COUNTY: Riverside	STATE: CA	ZIP: 92522
CONTACT(S) Dan Randall	TITLE Water Systems Operations Manager	PHONE (909) 782-5427
BEI PERSON MAKING CONTACT: Trey Johnston TJ		DATE: 4/4/94
SUBJECT: Drinking water wells in Riverside, Calif.		
SITE NAME: Riverside Plating	EPA ID: CAD 980885214	

DISCUSSION:

The City of Riverside maintains a blended system of approximately 48 drinking water wells. These wells provide drinking water to approximately 242,000 residents of Riverside, Calif. These drinking water wells may occasionally be blended with surface water from a single connection maintained by the Metropolitan Water District (MWD). When used, this connection may provide up to 1 percent of the drinking water used by the population of Riverside.

Mr. Randall will send a map showing the general locations of the active drinking water wells within the system.

CONTACT CONCURRENCE: D Randall **DATE:** 4-19-94

CONTACT REPORT

AGENCY/AFFILIATION: City of Colton		CODE: GW
DEPARTMENT: Public Works Water Department		
ADDRESS: 650 N. LaCadena	CITY: Colton	
COUNTY: San Bernardino	STATE: CA	ZIP: 92324
CONTACT(S) Lorraine June	TITLE Administrative Analyst	PHONE (909) 370-5152
BEI PERSON MAKING CONTACT: Jordie Bornstein JLB		DATE: 6/14/94
SUBJECT: Water supply information for City of Colton drinking water wells		
SITE NAME: Crane Co.		EPA ID: CAD 066135690

DISCUSSION:

The City of Colton currently operates a total of 13 drinking water wells. The water from the wells is not blended with surface water and is distributed through 8,720 connections. Each well contributes approximately equally to the system. Well identifiers and approximate locations are as follows:

- Wells 9 and 17 - west of Adel Ct.
- Well 19 - north of Rialto Ave., between Rancho Ave. and Mt. Vernon Ave.
- Wells 16, 13, and 8 - south of Rialto Ave. near Well 19
- Well 23 - Fairway Dr. near Orange Hill Rd.
- Wells 14, 7, 5, and 6 - south of Walnut Ave. near the railroad
- Well 22 - Rich Dauer Park on Sugar Pine Ln.
- Well 15 - in the middle of Watwood Ave.

In addition, the City of Colton is planning to have the following two wells operating on-line by the end of the summer:

- Katz well - Cooley Ln. near Hunts Ln.
- Well 24 - Meridian Ave. north of Olive St.

CONTACT REPORT

AGENCY/AFFILIATION: Riverside Highland Water Co.		CODE: GW
DEPARTMENT:		
ADDRESS: 1450 Washington St.	CITY: Colton	
COUNTY: San Bernardino	STATE: CA	ZIP: 92324
CONTACT(S) Rich Haubert	TITLE	PHONE (909) 825-4128
BEI PERSON MAKING CONTACT: I-Pei Hsiu Hodge JHH 13		DATE: 8/9/94
SUBJECT: Riverside Highland Water Co. well information		
SITE NAME: Hanford Foundry Co.	EPA ID: CAD 981630833	

DISCUSSION:

The Riverside Highland Water Co. maintains a blended system of 16 operating groundwater wells which serve approximately 14,000 people. Groundwater contributes 100 percent of the drinking water supply. No single well or intake contributes greater than 40 percent of the total supply to the system. Four standby wells are maintained on a regular basis and are used at least once a year. No wells have been closed due to contamination.

APPENDIX E

SITE RECONNAISSANCE INTERVIEW AND OBSERVATIONS REPORT

Bechtel Environmental, Inc.
P.O. Box 193965
San Francisco, CA 94119-3965

OBSERVATIONS MADE BY: Subbu Mahadevan DATE: January 25, 1995

FACILITY REPRESENTATIVE(S) and TITLE(S):

Ralph Guyaux, Site Owner
Bill Norton, California Environmental Protection Agency,
Regional Water Quality Control Board, Santa Ana Region

SITE: Guyaux Landfill

EPA ID: CAD 983652033

A site reconnaissance was conducted at the Guyaux Landfill site on January 25, 1995. The day was overcast with steady rain and the temperature was approximately 55°F. The Bechtel Environmental, Inc. (BEI) representative, Subbu Mahadevan, conducted the site reconnaissance with Ralph Guyaux and Bill Norton at 11 a.m. to gather information on the site location and size, site history, processes used, and any hazardous waste generated, treated, stored, or disposed of on site. The reconnaissance included a site tour during which photographs were taken.

The following information was obtained during the site reconnaissance:

The Guyaux Landfill site is located in an industrial area of Colton, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by the Santa Ana River.

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994. Ralph Guyaux acquired title to the property in July 1994.

The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill sometime between 1930 and 1985. The rest of the site is in a floodplain. The top of the former landfill is approximately 15 feet above the rest of the site. The entire site is unpaved, unfenced, and covered by vegetation.

Since 1930, 6 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton were disposed of in the landfill portion of the site. In the 1950s, this portion of the site was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s, the landfill portion of the site was used as a recycling/disposal yard. Between 1977 and 1985, waste materials from two nearby sites were

deposited on site. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited on site. The landfill also accepted waste slag from the Griffin Wheel Company. Since 1985, the landfill has been used for the temporary storage of cars and machinery prior to dismantling.

At the time of the site visit, piles of waste slag were noted along the face and on top of the landfill. Several piles of used tires and pieces of old furniture were dumped on site. In addition, up to 10 empty 55-gallon drums were on site.

The California Environmental Protection Agency, Regional Water Quality Control Board, Santa Ana Region (RWQCB) has been involved with the site since 1977. The RWQCB has requested a Solid Waste Assessment Test from Ralph Guyaux. The site owner has not complied with this request. No site-specific soil or groundwater sampling events have been conducted. However, slag samples have been analyzed at the Griffin Wheel Company site. In addition, the Santa Ana Watershed Project Authority (SAWPA) has conducted groundwater sampling in the vicinity of the site. A monitoring well installed by the SAWPA is outside the eastern boundary of the site.

Groundwater flow direction beneath the site and surface water runoff across the site are to the south. Surface water runoff from the site flows into Santa Ana River, which flows into the Pacific Ocean, approximately 40 miles downstream of the site.

Printed on 50% recycled paper.

MEMORANDUM

DATE: February 22, 1995

TO: Dixie Lass, Chief
Land Disposal Section

FROM: William Norton
William Norton, ES III
Land Disposal Section

SUBJECT: Guyaux Landfill (located in City of Colton) - background and rationale for not taking enforcement action.

RECENT CHRONOLOGY

Nov. 30, 1994

I received a complaint at about 4 p.m. by phone from Colton citizen Suzanne Carr that landfilling or grading was taking place at the site as we were speaking on the phone. When I went to the site at 4:30 p.m. the same afternoon, no activity, or evidence of activity, was noted.

Dec. 7, 1994

Bruce Paine, John Fernald and I met with Suzanne Carr, and representatives of San Bernardino County Hazmat, the LEA, Riverside Highland Water Company, and several residents who lived in the adjacent neighborhood. A reporter from the San Bernardino County Sun newspaper named Cerise Valenzuela also attended (without our knowledge or prior approval). There was a joint discussion of the landfill history and possible hazards and potential actions by various agencies. We received a copy of the USEPA Preliminary Assessment Report, dated June 9, 1993, and written by Roy F. Weston Inc.

Dec. 8, 1994

An article about the landfill appeared in the San Bernardino Sun. We received a copy of the hydrogeological investigation which was done for the SAWPA RIX Demonstration Project in 1989.

Dec. 11, 1994

A second article about the landfill appeared in the San Bernardino Sun.

Dec. 12, 1994

Bruce Paine of our office received a call from San Bernardino County District Attorney Joe Johns, expressing interest in pursuing a case against Ralph Guyaux. We set a meeting on the topic for late January.

Dec. 14, 1994

A third article about the landfill appeared in the San Bernardino Sun.

Jan. 10, 1995

We received a copy of **current** title information on the landfill. The County document indicated that Mr. Ralph Guyaux "acquired" the property in November 1973, and received title in July, 1994.

Jan. 19, 1995

Bruce Paine, Dixie Lass and I met with San Bernardino County District Attorney Joe Johns at the Hazardous Materials Investigation Task Force meeting. We briefed Mr. Johns and several other agency officials about the site at this meeting. We told the group that we were seriously considering taking enforcement action at the site based on water quality concerns.

Jan. 24, 1995

I spoke to Ruth Zandbergen, the prior owner of the property. She informed me that Mr. Guyaux began paying on a note to her deceased husband in 1973, and received title to the property after paying off the note in July of 1994.

Jan. 25, 1995

I accompanied Subbu Mahadevan from Bechtel Environmental Inc. on a site inspection he was conducting for USEPA. This was a follow-up inspection for the preliminary assessment conducted for USEPA by Roy F. Weston Inc. in 1993. We both met Ralph and Charlotte Guyaux at the site, and spoke to them about the history of the property, as well as present concerns and issues relating to it.

Jan. 26, 1995

Just prior to drafting a cleanup and abatement order, I conducted a more detailed review of the RIX hydrogeologic investigation, which was done in the vicinity of the site. Following this review, and after consulting with a staff member familiar with the RIX project, and with Dixie Lass and Kurt Berchtold of RWQCB

management, it was decided that enforcement action would not be appropriate at this time.

REASONS FOR NOT PURSUING ENFORCEMENT ACTION AT GUYAUX SITE

1) Based on well data from three wells in the RIX study (one upgradient, one 200 ft. immediately downgradient, and one between those two), the site does not appear to be having a significant impact on groundwater. Volatile organic compound (VOC) levels detected in the downgradient well (17 ppb PCE, 2 ppb TCE) seem consistent with levels found in many wells in the surrounding area. These wells are both up and downgradient of the landfill, and are commonly believed to be from a VOC plume originating from one or more sources in the area. The RIX study well upgradient of the site had a TCE level of 12 ppb (the Primary Drinking Water Standard for TCE is 5 ppb).

   Some metals, such as arsenic and barium, are **slightly** higher in the downgradient RIX well than the upgradient well. Only selenium exceeds the Primary Drinking Water Standard, and upgradient levels, but the exceedence of the standard is slight (about three times the standard - 32 ppb compared to a standard of 10 ppb). In addition, the downgradient RIX well sample was **not** filtered, which means the analysis of the sample included dissolved and suspended metals, which is not true of the two upgradient wells used for comparison. The result is that the metals levels found in this well may appear higher than the upgradient wells due to the difference in sampling technique.

2) The site is well graded and drains well, with no observed ponding during my last inspection, which was conducted in a substantial rain storm.

3) The site has not received wastes (other than tires and some refuse) for more than 12 years. Most of the wastes have probably been in place for more than 30 years. This leads us to hypothesize that if any significant VOC plume (significantly greater than the observed background levels) or metals were to appear in the downgradient well, they probably would have shown up during the RIX study sampling in 1989.

4) The RIX report established groundwater elevation and direction, an initial estimate of hydraulic conductivity of the water bearing zone, and yielded borehole and water quality data both upgradient and downgradient of the site. There is little that a further groundwater investigation could achieve, other than ongoing monitoring of these wells

for possible future changes in groundwater quality. Unfortunately, the downgradient well appears to have been backfilled with grout and abandoned.

WMN.guyaux.mem

Guyaux Landfill Timeline

Source Document:
United States Environmental Protection Agency – Region IX
Guyaux Landfill File – CAD 983652033
File Obtained from: Santa Ana Regional Water Quality Control Board – September 4, 2009

- **1930's:** Site used as disposal location to dump construction debris from the rebuilding of Colton post-flood.

- **1950's:** Site used for temporary storage of bricks and other construction materials prior to their reuse.

- **1955:** Residential area to the north of the site has been developed by this time.

- **1966:** Robert Zandberen purchased property from Henry Adams.

- **Nov 1973:** Ralph Guyaux starts paying on a 20-year note for the property and acquires use of the site. Citizen recall landfill operations began at the site in late 1973 and primarily consisted of recycling/disposal of waste materials from the Griffin Wheel Company and Crane Company sites located close to the landfill. Records show "black slag" from Griffin Wheel and metal/porcelain waste from Crane Company continued to be deposited at the site throughout the 1970's.

- **Early 1977:** Guyaux's CUP for the site expires. Guyaux files to extend his CUP.

- **Aug 1977:** 23 residents sign a petition asking city to require that the land be fenced, the dumping halted and CUP request denied.

- **Oct 1977:** State Solid Waste Board notifies the Water Board of the problems at the Guyaux landfill.

- **Nov 1977:** Water Board sends property owner a request to provide a Waste Discharge report. An incomplete report is submitted.

- **May 1978:** Colton Planning Commission denied a Conditional Use Permit for the site. The City has no record of any permit afterward, but residents reported that the dumping continued. Records show that Guyaux was denied a CUP because he lacked approval from the Water Board. In his defense, Guyaux argued that the Water Board would not consider his application until it was approved by the local jurisdiction (catch-22). Guyaux stated that he found it "ironic that the Crane Company has been dumping the very same kinds of materials into the County Flood Control dykes for many years".

- **1980's:** Site continues to be used as a dump for Griffin Wheel and the Crane Company.

- **May 1981:** The Water Board asks Guyaux to test piles of black slag on his land – Guyaux does not comply with the request.

- **Dec 1981:** Guyaux tells the Water Board that the test results of the slag were either lost or never reported. Dec. 29: City of Colton Planning Director sends letter to Water Board thanking them for sending copy of letter to Guyaux, and asking to be copied on all further correspondence regarding Mr. Guyaux's "illegal operation".

- **Apr 1985:** Water Board requests Guyaux install a groundwater monitoring network. Again, Guyaux does not comply with the Water Board's request.

- **1985:** Reported time when the site began to be used as temporary storage of cars and machinery for scrap and salvage value.

- **1988:** Water Board requests that Guyaux prepare and submit a Solid Waste Assessment Test (SWAT). Again, Guyaux does not comply with the Water Board's request.

- **1989:** Dames & Moore samples slag at Griffin Wheel property as part of an investigation of that site. Results in ppm: As – 105, Pb – 9,520, and Cd – 72.1.

- **Dec. 1989:** SAWPA conducts hydrogeologic study of area (by CH2M Hill) to determine if a 110-acre area (including Guyaux landfill) is suitable for a Rapid Infiltration/Extraction (RIX) facility. The report specifically identifies the Guyaux Landfill in Figure 2B-2. The report makes the following conclusions:

  - The entire area should be abandoned as a RIX facility
  - The contamination problem should be referred to the Regional Water Quality Control Board for further action.

- **Nov 1992:** Guyaux Landfill site identified under CERCLA and added to CERCLIS.

- **Jun 1993:** Weston completes a Federal Preliminary Assessment (PA) for the EPA. Report concludes that additional action under CERCLA is warranted and specifies a Site Investigation (SI).

- **Nov 1993:** Riverside pulls groundwater samples from Flume 2; (As = 15 ppb)

- **Mar 1994:** Suzzane Carr (resident) reports to Water Board that Colton continues to do nothing about the landfill problem and that there is evidence of continued disposal and burial of waste.

- **Jul 1994:** Guyaux finally obtains title to property.

- **Aug 1994:** Riverside pulls groundwater samples from Flume 2 (As = ND) and Flume 6 (As = 11 ppb).

- **Oct 1994:** Riverside pulls groundwater samples from Flume 2 (As = 8.3 ppb), Flume 3 (As = 11 ppb) and Flume 6 (As = 9 ppb).

- **Nov 1994:** Water Board (Bill Norton) receives another complaint from Suzanne Carr that landfill operations are on-going at the site. Norton goes to the site and observed no such activity.

- **Dec 1994:** Water Board receives a copy of the EPA PA conducted by Weston in 1993, and a copy of the hydrogeologic study done by SAWPA RIX for the demonstration project in 1989. Three news articles about the site appear in the SB Sun.

  District Attorney Joe Johns of SB County expresses interest in pursuing legal action against Ralph Guyaux.

- **Jan 1995:** Water Board meets with SB County District Attorney and tells him that the Water Board is seriously considering taking enforcement action at the site based on water quality concerns.

  Later in the month, Norton (Water Board) tells EPA that the Water Board will be issuing a Cleanup and Abatement Order to Ralph Guyaux concerning the landfill at the site.

- **Feb 1995:** Internal Water Board memo from Norton to Glass provides background and rationale as to why the Water Board decides to take no action against Guyaux at this time:

  - Site does not appear to be having a significant impact on groundwater yet.
  - RIX study down-gradient well sample, while showing evidence of contamination, was not filtered and therefore cannot be verified.
  - Site is now graded.
  - Site has not received waste for 12 years and most of the waste has been there for 30 years. Wells in the area are not showing any impact yet from the site.
  - The letter ironically references the RIX study and the EPA PA as supporting documentation as to why the Water Board has decided to take no action. In reality, both of these documents clearly suggest the strong potential of contamination present and the RIX study conclusion specifically eliminated the site from consideration based on contamination, and even suggested that the site be referred to the Water Board for further action.

- **Jun 1995:** BEI conducts an SI of the site for the Federal EPA (slag on face, tires, 10 empty drums, and evidence of 2 buried drums). Report concludes that additional action is warranted under CERCLA and recommends an Expanded Site Investigation (ESI).

- **July 1995:** After several attempts to force Guyaux to clear the site, Colton obtains a court order requiring the site be cleared by October of 1995 and the area fenced. Order issued pursuant to Property Maintenance Code violation (aesthetics only, no environmental). Guyaux complies with the order by October of 1995.

Water Board sends Carmen Kruger (Florez resident) a letter referencing the RIX study stating; "it does not appear that the Guyaux Landfill was having any notable effect on the groundwater quality as of 1989. We believe, based on the long time period over which wastes were deposited into this landfill, that if the groundwater impact was going to occur, it would have manifested itself in some way by the time of the RIX investigation." The letter goes on to lament that they should sample the down-gradient well again, but it was destroyed after the RIX study.

- **Aug 1995:** Riverside pulls groundwater samples from Flume 2 (As = 4 ppb), Flume 3 (As = 8.8 ppb) and Flume 6 (As = 11 ppb).

- **Oct 1995:** Another article in the SB Sun about the site.

  Colton sends a letter to Dixie Glass at the Water Board asking for documentation of any contamination or violations for businesses located by Guyaux property in reference to past dumping at the site (no response in EPA file).

- **Nov 1995:** EPA sends Water Board (Bill Norton) copy of the SI showing that further assessment is recommended.

- **Mar 1996:** BEI conducts the ESI for EPA. Site is graded flat at time of study. Soil results of interest include:

  - As: 39.9 ppm site v. ND for background
  - Ba: 313 ppm site v. ND for background
  - Cd: 25.2 ppm site v. ND for background
  - Cr: 383 ppm site v. 7.6 for background
  - Pb: 5,600 ppm site v. 66.4 background
  - Toluene at 150 ppb site v. 38 ppb for background

- **May 1996:** Water Board and EPA Region IX do a joint site visit.

- **Mar 1997:** EPA sends a letter to Ralph Guyaux stating that the site has been removed from CERCLIS because groundwater sampling show concentrations of hazardous substances detected in down-gradient wells were not significantly (more than three times) greater that what was found in up-gradient wells. However, the letter stated that the results of the soil sampling indicate that hazardous substances including arsenic, cadmium, chromium, lead, manganese, mercury and toluene are present at concentrations significantly above background levels, and that since the landfill is not covered there is a risk of exposure.

  The letter closes by stating that the matter is being handed over to DTSC and that the DTSC will be the lead agency for further investigation and remediation of the landfill.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX

Mr. Ralph Guyuax
16955 Washington Street
Riverside, CA 92504

Re: Guyuax Landfill
CAD 983652033

Dear Mr. Guyuax:

Enclosed find the report of a recent evaluation of the Guyuax Landfill conducted by the U.S. Environmental Protection Agency. This evaluation was conducted under the authority of Section 104 of the Comprehensive Environmental Response, Compensation, and Liability Act, as amended, 40 U.S.C. § 9604, commonly known as Superfund.

The results of our groundwater sampling show that concentrations of hazardous substances detected in the groundwater wells downgradient of the landfill were not significantly (more than three times) greater than what was found in groundwater wells upgradient from the landfill. For this reason, this site does not qualify for listing on the federal Superfund [National Priorities] List. However, the results of our soil sampling indicate that hazardous substances including arsenic, cadmium, chromium, lead, manganese, mercury and toluene are present at concentrations significantly above background levels. Since the landfill is not secured from public access and the soil is uncovered, there is a potential of exposing the public to the contaminants.

We have discussed the conditions at the landfill with California Department of Toxic Substances Control. They will be the lead regulatory agency for you to work with as you further investigate the hazardous conditions at the landfill. Upon the request of DTSC, we will provide technical assistance in selecting options for investigating and remediating the landfill.

An EPA Region IX remedial site assessment decision record is included at the end of the report.

Please forward any written comments to:

Gordon Woodrow [H-8-1]

WORKPLAN
for
SITE INVESTIGATION

at

South Colton Site
Parcels 016336212, 016336226, and 016336227
Colton, California

1.0 INTRODUCTION

On behalf of The Maturin Group (Maturin) , Environmental Engineering & Contracting (EEC) has prepared this workplan to remediate lead-impacted soil at the above referenced site (Subject Property). The Subject Property location is presented on Figure 1. During previous investigation activities performed at the Subject Property, elevated concentrations of lead were identified in shallow soil at three locations. To remediate soil at these locations EEC is proposing to excavate and dispose of the lead containing soil. All activities will be performed under the direct oversight and approval of the Regional Water Quality Control Board – Santa Ana Region (RWQCB) and a State of California Professional Geologist (PG). This workplan outlines the technical approach for the remedial action.

2.0 BACKGROUND

The following section of this workplan presents background information for the Subject Property. Information described in this section includes a description of: site location, topography, geology, hydrogeology, history of the former Guyaux Landfill, and the intended future use of the Subject Property.

2.1 Site Location

The Subject Property is located at the southern end of the City of Colton, adjacent north of the Santa Ana River (Figure 1). More specifically, it extends south from the ends of Flores and Fernandez Streets. The Subject Property has an irregular shape and consists of three undeveloped vacant parcels, totaling approximately 29 acres. Several dirt trails traverse the Subject Property, which appear to be regularly used. These parcels are:

- Lot 20 – Assessor's Parcel Number 016336212, consisting of 16.931 acres zoned as open space.
- Lot 21 – Assessor's Parcel Number 016336226, consisting of 10.003 acres zoned as open space.
- Lot 34 – Assessor's Parcel Number 016336227, consisting of 1.122 acres zoned as open space.

The northern portion of the site contains a former uncapped and unlined waste disposal site (the Guyaux Landfill) and the remainder of the Subject Property has always been and is currently undeveloped land. The proposed soil remediation is located within the former Guyaux Landfill, which is the northern most portion of the Subject Property (Figure 2). Electrical transmission and distribution pole easements cross the north side of the project site and the adjoining properties in an east-west direction. Existing development in the immediate vicinity of the project site is a mix of industrial and residential land uses. The site is bounded

north by residential properties, to the west by railroad tracks and industrial properties, and to the south and east by vacant property and the Santa Ana River.

2.2 Topography

The topography for the Subject Property generally slopes from north to south with a slight slope from east to west, which is the general trend of the Santa Ana River. There is a drop in elevation of approximately 25 feet from the northeast portion to the southwest portion of the Subject Property. The elevation in the northeast portion of the Subject Property is approximately 935 feet above mean sea level (msl) and approximately 910 feet above msl in the southwest portion of the Subject Property.

There is numerous drainage swales located throughout the Subject Property and generally have a northeast to southwest trend. The size and shape of the drainage swales have appeared to be influenced by fill material and by storm water runoff from the properties located to the north of the Subject Property.

2.3 Regional and Site Geology

The Subject Property is located within the Peninsular Range Geomorphic Province on the central portions of a large alluvial plain. The large alluvial plain was formed from several large alluvial fans created from the San Gabriel and San Bernardino Mountains and from wash deposits from the Santa Ana River. The Subject Property is located in the central portion of the Perris Block. There are no known faults (active, potentially active, or inactive) located at the Subject Property, however the Rialto-Colton Fault is located less than 3 miles to the north. The San Jacinto Fault Zone is located to the east, the Elsinore Fault Zone is located to the west, and the Cucamonga Fault Zone is located to the north of the Perris Block.

The Subject Property is underlain by a mixture of non-engineered undocumented artificial fill and alluvial wash deposits. These materials overlay older alluvial wash deposits from the Santa Ana River. Soils encountered during drilling activities in November 2009, consisted of sandy silts and silty sands in the upper ten feet, and sands and gravelly sands from approximately 10 feet below ground surface to approximately 50 feet below ground surface (termination of borings).

2.4 Site Hydrogeology

Four groundwater monitoring wells were installed and developed at the Subject Property in September 2009. In October 2009, depth to groundwater in wells MW-1 through MW-4 was measured from approximately 85 to approximately 94 feet below ground surface (bgs).

2.5 History of the Guyaux Landfill

The Guyaux Landfill was formerly located in the northern portion of the Subject Property and is the focus area of this workplan. The property was previously identified as a potential hazardous waste site and was investigated by U.S. Environmental Protection Agency (EPA) Region IX. A preliminary assessment (PA) was performed by Roy F. Weston in June 1993. A site investigation (SI) was performed in June 1995 and an expanded site investigation was performed in August 1996 by Bechtel Environmental Incorporated.

The Guyaux Landfill comprises about four acres and is topographically approximately 15 feet higher than the remainder of the site. The previous investigations indicate that waste materials were dumped on the site from the 1930s through the 1980s. Based on information obtained from a Phase II Environmental Site Assessment

and Site Investigation report prepared by EastStar Environmental Group, Inc (EastStar), approximately 98,000 cubic yards of waste material and soil were placed in this area. Disposal into the dump has reportedly included:

- Construction debris from rebuilding the City of Colton in the 1930s
- Brick and construction material recycling in the 1950s
- Foundry slag from Griffin Wheel Company and broken porcelain and plaster molds from Crane Company in the 1970s and 1980s

The surface of the site was an unofficial junkyard for car and machinery dismantling from 1985 through the mid-1990s. No disposal activities appear to have taken place on the landfill since the mid-1990s. The previous reports noted empty drums on the landfill surface and partially buried drums on the southern and eastern landfill faces. No drums were observed during EastStar's investigation. Municipal solid and green wastes do not appear to have been disposed in the dump. The disposal area does not appear to be lined. The top surface of the area is unpaved. The ground surface consists of relatively permeable sandy soil. Sparse vegetation, consistent with the remainder of the property, is growing on the landfill surface and side slopes. Some voids and possible settlement sink holes were apparent in the landfill surface and the exposed side slopes, during previous investigations.

Waste disposal appears to have occurred against a natural embankment formed by the former path of the Santa Ana River along the north and west sides of the disposal area. The fill then extends to the south and east to a 10 to 15 foot high face on the south and east sides of the four acre disposal area. Previous site investigation reports indicated that the area may have been regraded; indicating that the actual lateral extent of the landfill may extend beyond this face. There is no indication that the waste disposal area has ever been capped.

2.6 Development of the Subject Property

The property owner intends to raise the grade of the Subject Property out of the floodway using imported engineered fill. The fill will be blended, screened and processed to produce a high quality borrow material that will be used to form the engineered fill. All incoming soil will be fully characterized before it is delivered to the site.

Accepted soil will be screened and used as the raw material to manufacture the engineered backfill. The engineered fill will raise the grade of the site and will accomplish the following goals:

- Remove the property out of the 100-year floodplain by elevating the site.
- Reduce the existing fugitive dust conditions at the adjoining residential properties from wind blowing over the existing fine, loose soils on the site.
- Fill and grade the site with an engineered fill containing superior overall strength characteristics and bearing capacity, compared to the existing site soils.
- Cover the existing Guyaux Landfill impacted area to prevent direct contact exposure to the dump, limit percolation and remove the risks associated with open voids on the surface and face of the dump.

The engineered fill project will require approximately 500,000 cubic yards of product.

3.0 PROPOSED FIELD WORK

The goal of the proposed remedial activities is to remove three relatively small areas of soil from which elevated concentrations of lead were detected during previous onsite sampling. The following summarizes the proposed scope of work to remedial areas of concern.

3.1 Pre-Field Activities

The following activities will be performed prior to initiating field activities.

3.1.1 Regulatory Notifications

EEC will notify the RWQCB a minimum of 72 hours prior to commencing field activities.

3.1.2 Underground Service Alert Notification

In compliance with California Government Code Section 4216-4216.9, EEC will mark the proposed soil remediation locations with white paint and marker flags so that the proposed locations are visible to underground surface alert (USA) members. USA is a regional notification center that notifies owners and operators of subsurface utilities (water, gas, electric, sewer, oil lines, etc.) and informs them of a contractors' intent to perform subsurface work. EEC will notify USA of the intent to perform subsurface work 48 hours prior to the beginning of the onsite activities.

3.1.3 Site Health and Safety Plan

EEC will conduct field work at the site in accordance with the protocols established in EEC's Site Health and Safety Plan (H&SP). The H&SP will address the potential health hazards that might be encountered at the worksite and describe the basic safety procedures that EEC personnel and subcontractors will follow during field activities. Each morning prior to commencing work, a tailgate meeting will be held to continuously reinforce field personnel with potential safety concerns. The H&SP will be available onsite during all field activities. A copy of the H&SP is included as Appendix A.

3.2 Field Activities

The following section of this workplan describes the onsite activities that will be conducted during the removal of lead impacted soil at the Subject Property. EEC assumes that the proposed scope of work will be completed in one field day.

3.2.1 Remedial Excavation Activities

Soil containing elevated concentrations of lead will be remediated at the Subject Property by excavation. EEC will utilize a backhoe to remove impacted soils at each location. It is assumed that one to two drums per excavation will be required to remove lead exceeding the action level of 1,000 milligrams per kilograms (mg/kg) to complete the remedial project. The following table presents the approximate size of each excavation based on the depth of the impacted soil horizon.

Excavation ID	Depth of Lead Detection (feet)	Proposed Excavation Size	Proposal Drum Totals
A	1.5	1.5 x 1.5 x 2	1
B	3.5	1.5 x 1.5 x 3.5	2
C	2	1.5 x 1.5 x 2.5	1

If elevated concentrations of lead are detected in the confirmation samples collected, EEC will return to the Subject Property and excavated an additional one foot of material and re-collect confirmation samples. This process will be repeated until laboratory results indicated that soil contained lead greater than 1,000 mg/kg has been removed. Each excavation location will be recorded utilizing a hand held global positioning system (GPS) hand held unit for future reference.

3.2.2 Soil Sampling Procedures

One undisturbed soil sample will be collected from the bottom of each remedial excavation. Once the total depth of each excavation is reached, a soil sample will be collected by advancing a soil core sampler, with a slide hammer, containing a 2-inch diameter by 6-inch long stainless steel sampling sleeve into undisturbed soil. Once the sampling sleeve has been filled with soil, it will be removed from the core sampler. The ends of the sleeve will be sealed with Teflon and covered with plastic end caps. The stainless steel sleeves will be labeled with the date and time of collection and a sample identification number. The samples will then be sealed in a plastic bag and placed in a chilled ice chest immediately after collection. Within 24 hours, the samples will be relinquished under standard Chain-of-Custody protocols to a State-certified laboratory for analyses.

3.2.3 *Sampling Equipment Decontamination*

The equipment utilized during soil sampling will be decontaminated between each consecutive use in accordance with the following procedures:

1. Rinse with water using a brush to remove soil and mud.
2. Wash with a non-phosphate detergent and water using a second brush.
3. Double rinse with water.
4. Allow equipment to air dry before reuse.

4.0 LABORATORY ANALYSIS

The collected soil samples will be stored in a chilled ice chest until relinquished under standard Chain-of-Custody protocols to a State certified analytical laboratory for analyses. The soil samples will be analyzed in accordance with EPA Method 6010/7410 for lead.

In addition, one soil sample will be collected from the contained material associated with each excavation for classification purposes. The classification sample, used to determine disposal classification, will be analyzed for lead by EPA Method 6010/7410, Soluble Threshold Limit Concentration (STLC) and the toxicity

characteristic leaching procedure (TCLP) for lead (if necessary), total petroleum hydrocarbons by EPA Method 8015, and VOCs by EPA Method 8260B.

5.0 WASTE MANAGEMENT

The excavated soil generated will be contained in a Department of Transportation (DOT) approved steel 55-gallon drum during field activities. Once the analytical data has been returned from the laboratory and reviewed the soil will be profiled for disposal. Following profiling the soil will be transported offsite under manifest for proper disposal. A copy of the waste manifest will be included in EEC's final report documenting the remedial event.

6.0 DATA EVALUATION AND REPORT PREPARATION

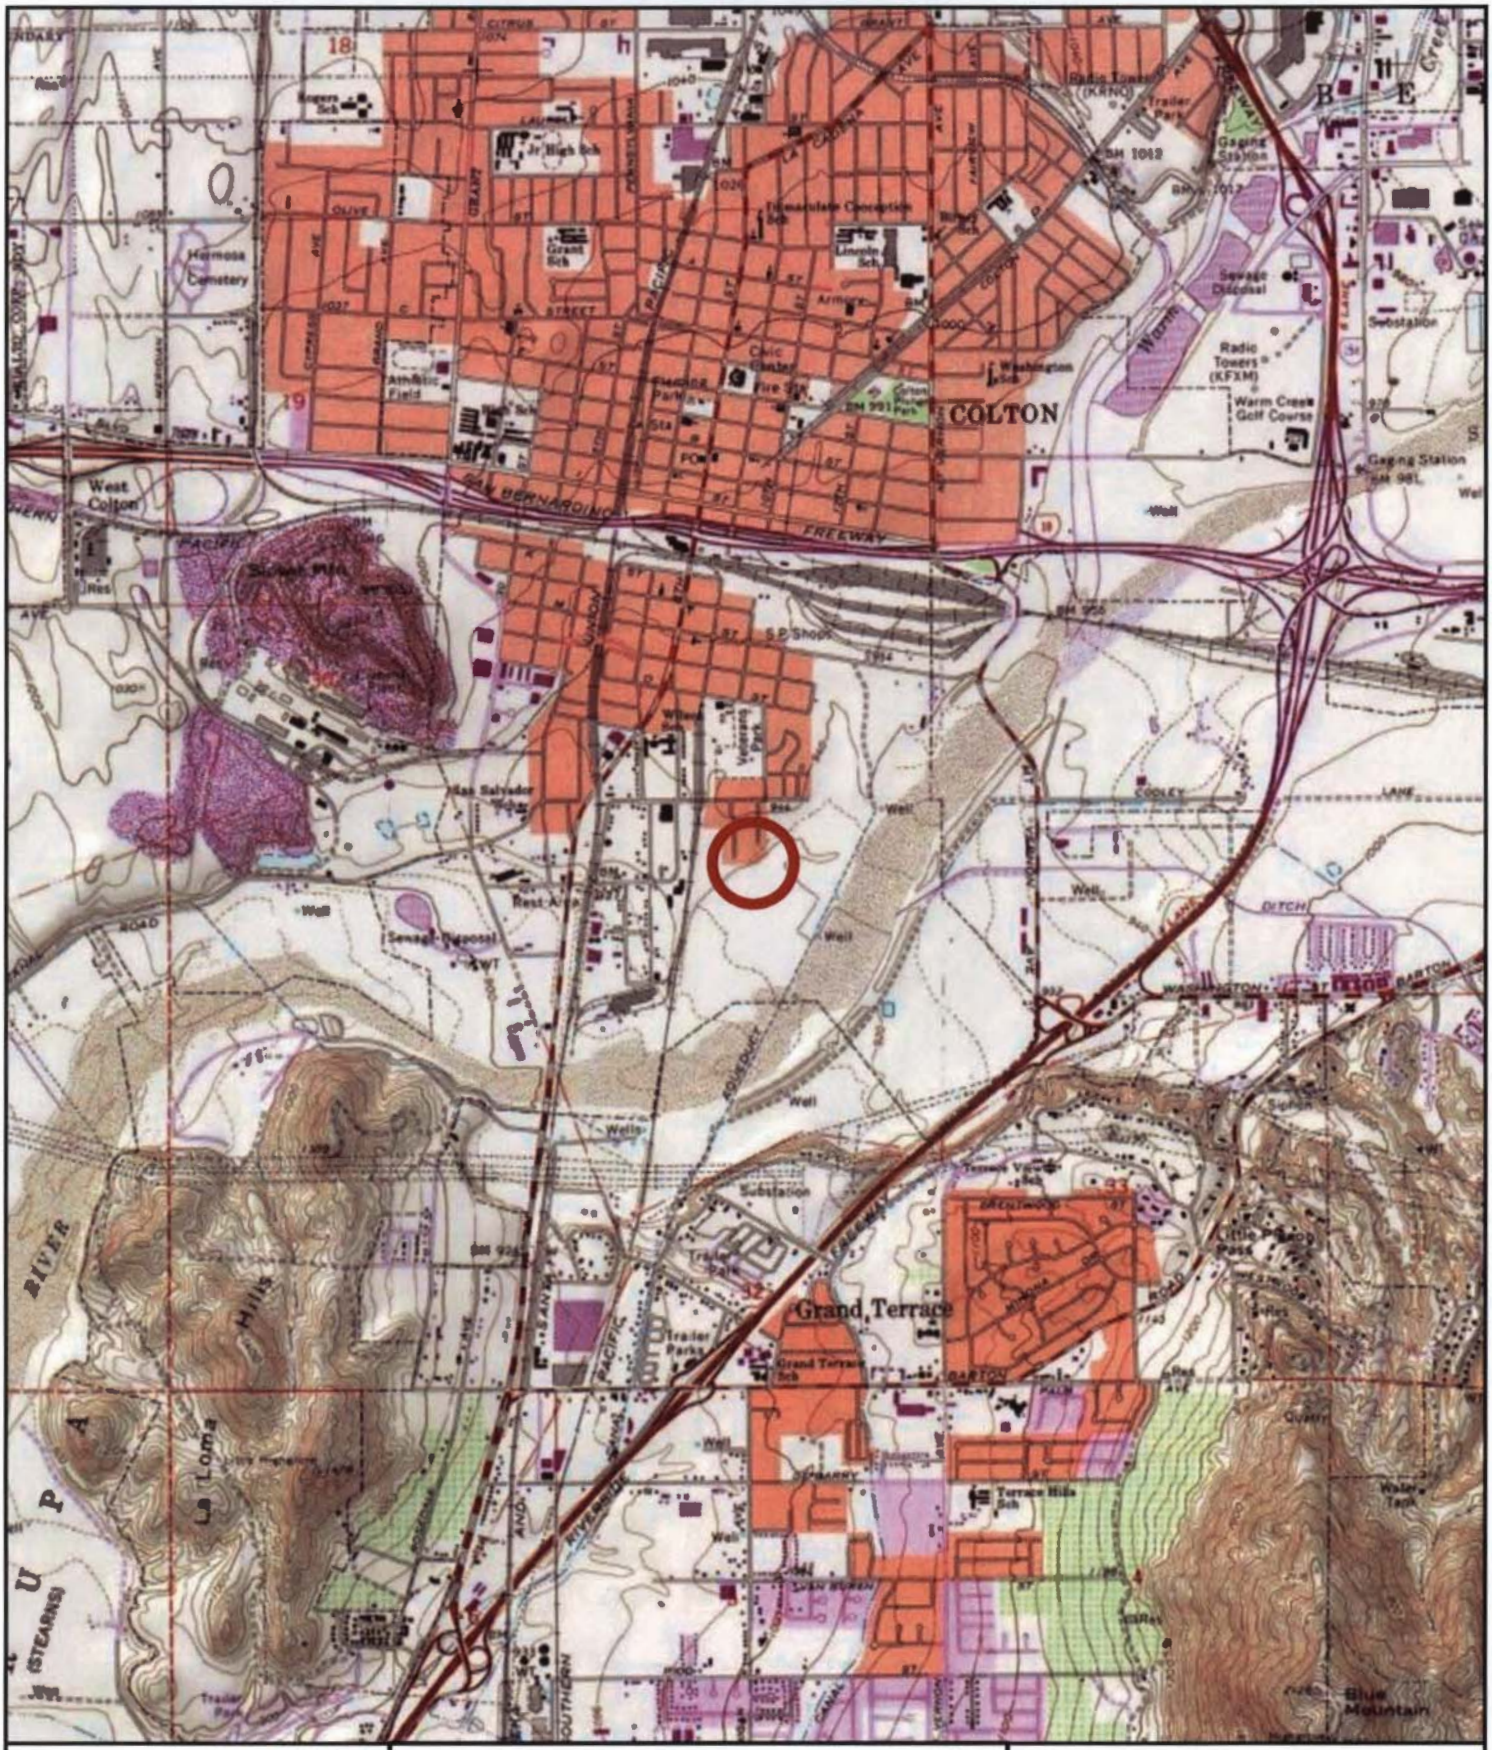
After completion of the remedial activities and laboratory analyses, EEC will evaluate the analytical data and prepare a technical report for submittal to the RWQCB.

The report will summarize the following:

- Introduction and background of the site;
- Remedial field activities and sampling procedures;
- Laboratory analytical results; and
- Conclusions and recommendations.

The report will also contain the following documentation:

- Tables summarizing laboratory test results of soil samples;
- Figures showing the site location, site plan, remedial excavation locations, and sample locations;
- Waste disposal manifest; and
- Laboratory analytical reports and Chain-of-Custody forms.



All field work and report preparation will be directly supervised by a California Professional Geologist.

APPENDIX C HEALTH & SAFETY DAILY SIGN IN SHEETS

ENVIRONMENTAL ENGINEERING AND CONTRACTING
SITE HEALTH AND SAFETY PLAN

1.0 INTRODUCTION

This Site Health and Safety Plan (SHSP) has been developed specifically for subsurface environmental investigations in which lead may be encountered in the soil. The purpose of this document is to provide detailed information regarding anticipated site health and safety matters, and establish policies and procedures adequate to protect workers, the public, and environment from predicted site hazards. The information provided in this plan is based, in part, on best available information regarding the site. If unexpected health and safety issues arise during the course of the investigation, this plan will be modified to reflect these new conditions. The conditions detailed in this SHSP apply to EEC employees and its subcontractors working on the site. A copy of this SHSP will be available at the site during all field activity.

While based on the minimum requirements of 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response (HAZWOPER), this document has been developed with the express purpose of implementing a high quality safety and health program. These SHSP guidelines are a "living document" to be modified and updated as new regulations and other requirements are issued.

2.0 CHAIN OF COMMAND AND KEY PERSONNEL

All EEC personnel have key responsibilities in maintaining a high quality site health and safety program. The responsibilities of each employee are discussed in the following sub-sections. An organizational chart is shown on the following page.

2.1 Health and Safety Officer

EEC's Health and Safety Officer (HSO) is responsible for the implementation and compliance with applicable regulations and guidelines established in this SHSP. The HSO has ultimate responsibility for site health and safety issues and has "stop work" authority. In addition, the HSO has the following responsibilities:

- Compliance with health and safety training and medical surveillance requirements;
- Periodic site inspections to evaluate SHSP implementation;
- Verifying each employees' suitability for work based on employee training and physician recommendation;
- Periodically inspecting protective clothing and equipment;
- Advising medical personnel of potential exposure and consequences;
- Participating in the preparation and implementation of the SHSP;
- Coordinating emergency medical care.

2.2 Project Manager

EEC's Project Manager is responsible for developing the SHSP based on available knowledge of the site. The Project Manager is directly responsible for the performance of all EEC personnel and EEC subcontractors at the site. In the event that the Project Manager becomes aware of any deficiencies in the implementation of the SHSP, this individual may recommend changes to the plan or interpretation of the plan and will take appropriate action by consulting with the HSO. In addition, the Project Manager has the following responsibilities:

- Management of the project;
- Preparation of the work plan, preparation of the HASP, and designation of the field team;
- Designation of an individual within each project to act as the on site health and safety coordinator;
- Assuring that subcontractors are in compliance with EEC health and safety requirements;
- Identifying work-site confined spaces;
- Granting access permission for visitors, new hires, etc., and coordinates activities with appropriate officials;
- Confirming each team member's suitability for work base on employees training and physician's recommendation;
- Briefing field teams on their specific assignments;
- Coordinating with the HSO on safety and health requirements;
- Liaison with public officials; and

2.3 Field Team Lead - Staff Engineer/Geologist/Engineer

EEC's field team leader will be responsible for assessing and enforcing health and safety practices at the site, and shall be present during all work activities. The Field Team Leader will conduct a project-specific meeting discussing safety issues and project objectives before beginning work. If respiratory protection is required, the Field Team Leader will be responsible for conducting fit testing of the respiratory protective devices. The Field Team Leader will also relay any observed health and safety deficiencies, hazards, or changes in site conditions immediately to the Project Manager. The Field Team Leader has the following responsibilities:

- Management of field operations;
- Execution of the work plan and schedule;
- Conducting daily tailgate safety meetings;
- Recording names and job assignments of on site personnel;
- Assuring compliance with Hazard Communication Standards;
- Conducting health and safety inspections on a daily basis, including the observing personnel for signs of impaired health due to contaminant exposure, heat stress, or other stresses;
- Coordinating with the Project Manager or HSO in determining protection levels;
- Inspecting personal protective equipment, verify its use, and proper decontamination;
- Recording employee illness/injuries and report on exposure monitoring results (if required);
- Controlling site entry and exit;
- Reporting infractions or incidents to the Project Manager or HSO;
- Maintaining communication with working parties;
- Obtaining emergency assistance;
- Documenting field activities;

2.4 Field Personnel and Subcontractors

All EEC personnel and subcontractors have the responsibility to read the SHSP and understand their assigned tasks, and how to perform those tasks in accordance with the SHSP. Each individual is responsible for informing a supervisor of any health and safety hazards, symptoms of exposure, injury, malfunctioning equipment, identification of any previously unknown contaminant, or other unanticipated condition. All EEC employees and subcontractors must attend all required safety course work and meetings and maintain documentation indicating that they have completed the same. All employees and subcontractors are required to wear personal protective equipment when requested (employees and contractors are allowed to modify personal protective equipment requirements, but only in a manner which increase the minimum safety requirements). Employees or contractors who refuse or fail to follow the standards set forth in this SHSP are subject to disciplinary action, which may include dismissal from the site. In all cases not specifically mentioned, employees and contractors are expected to use good judgment and shall refer all questions to appropriate supervisors and health and safety personnel.

2.5 All Parties

All personnel entering the site will be required to review the SHSP and document such review prior to actual work at the site. No personnel will be permitted to enter restricted areas without approval of the Project Manager or Field Team Leader.

3.0 HAZARD ASSESSMENT

Personnel at the site may be exposed to both chemical and physical hazards. All personnel who enter the site have the potential to be exposed any or all of these hazards. The following personnel may be present on site during the project:

- Project Manager
- Field Team Leader
- Staff Personnel
- Technicians
- Drillers
- Heavy Equipment Operators
- Management Representatives

3.1 Chemical Hazards

This section discusses major contaminants that may be encountered in the work environment during this project. The primary contaminants anticipated to be encountered during this investigation are indicated in Table 1. The primary health hazards associated with these substances are provided in Table 1. Applicable 8-hour permissible exposure limits (PELs) and threshold limit values (TLVs) are also listed in Table 1. These exposure limits are not anticipated to be exceeded. A discussion of PELs and TLVs are included in Appendix A. If other chemical compounds are later identified to be present at the site, an addendum to this SHSP describing the health hazards, PELs and TLVs will be prepared.

Potential exposure pathways at the site include inhalation, dermal contact, and ingestion. Protective clothing,

including gloves, will be mandatory for all personnel who may potentially come in contact with the contaminants. In addition, air purifying respirators with organic vapor HEPA filters, will be required if the PELs are exceeded in the breathing zone, or if an employee elects due to discomfort.

For each constituent identified in Table 1, the known toxic effects, routes of entry, and target organs are indicated. This information will be communicated to all onsite personnel during tailgate safety meetings prior job start up.

TABLE 1
EXPOSURE LIMITS AND HEALTH HAZARDS OF POTENTIAL CONTAMINANTS

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Acetone	750/750 ppm REL = 250 ppm	STEL = 1000 ppm C = 3000 ppm	Minty sweet odor – 20 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; dizziness	Dermatitis
	Ammonia	25/25 ppm	STEL = 35 ppm	Pungent, irritating odor – 0.04 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation/burning	None cited
	Antimony	0.5/0.5 mg/m^3	None cited	None cited	Inhalation; Ingestion	Eye, skin and mucous membrane irritation	Pneumoconiosis
	Arsenic	0.01/0.1 mg/m^3	NIOSH Ceiling = 0.002 mg/m^3	Odorless solid	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation	Confirmed human carcinogen; lung, skin and lymphatic cancer; GI and skin disorders; peripheral neuropathy
	Asbestos (all forms)	0.1 f/cc/ None cited Amosite (0.5 f/cc) Chrysotile (2 f/cc) Cricidolite (0.2 f/cc)	STEL = 1 f/cc (30 minute TWA)	Asbestos fibers do not have warning properties	Inhalation; Ingestion	None cited	Asbestosis confirmed; known human carcinogen; cancer of the lungs and digestive tract; mesothelioma.
	Boron oxide	10/10 mg/m^3	None cited	None cited	Inhalation; Ingestion	Eye and respiratory irritation	None cited
	Barium, soluble compounds	10/10 mg/m^3 (as total dust)	None cited	White, odorless solids	Inhalation; Dermal; Ingestion	Eye, skin, and respiratory irritation	Neuromuscular disturbances; pneumoconiosis; heart problems
	Benzene	1/10 (0.1) ppm [SKIN]	STEL = 5 ppm TLV-STEL = 0.3 ppm	Sweet solventy odor – 1.5 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; nausea	Confirmed human carcinogen; leukemia; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Beryllium	0.002/0.002 mg/m^3	Ceiling = 0.025 mg/m^3 STEL = 0.005 (30 min)	Grey, odorless solid	Inhalation	Dermatitis; pneumonitis; respiratory irritation; spontaneous	Berylliosis; suspected human carcinogen
	n-Butyl acrylate	10/10 ppm	None cited	Fruity odor – 33 ppm	Inhalation; Dermal	Eye and skin irritation	Dermatitis
	Cadmium (metal dust and soluble salts)	0.005/0.01 mg/m^3 (0.01 mg/m^3 total dust; 0.002 mg/m^3 respirable dust)	OSHA Ceiling = 0.6 mg/m^3 ACGIH (respirable dust = 0.002 mg/m^3)	Odorless solid	Inhalation; Dermal; Ingestion	Skin and respiratory irritation; pulmonary edema; CNS effects; nasal perforation	Emphysema; kidney damage; anemia; suspected human carcinogen
	Carbon disulfide	4/10 ppm	STEL = 12 ppm	Ether-like irritating sweet odor – 0.01 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS and peripheral nervous system depression; headache; dizziness	Possible liver, kidney and cardiovascular injury; peripheral neuropathy
	Carbon monoxide	35/25 ppm	C = 200 ppm	Colorless, odorless gas	Inhalation	Chemical asphyxiant; CNS depression.	Possible neuropsychiatric damage
	Cesium-137	None cited	1.25 REM/qtr	None cited	Inhalation; Dermal	Bone marrow destruction; anemia; infection; GI disturbances; eye, skin, and respiratory damage; deathly	Cancer; sterility; leukemia; diseases of bone marrow
	Chlordane	0.5/0.5 mg/m^3	[SKIN]	Pungent, chlorine-like odor	Inhalation; Dermal; Ingestion	Skin, GI and respiratory irritation; tremors and convulsions; blurred vision; confusion	Liver, kidney and respiratory damage; dermatitis; suspected human carcinogen
	Chlorobenzene	75/10 ppm	None cited	Sweet almond odor – 0.2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; skin burns	Possible liver, kidney and lung damage; dermatitis
	Chromium (metal and di/tri valent compounds)	0.5/0.5 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Respiratory irritation	Possible lung fibrosis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Chromium (hexavalent compounds)	0.05/0.05 mg/m^3	C = 0.1 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and nasal ulcerations	Possible liver and kidney damage; dermatitis; suspected human carcinogen
	Chrysene	Note cited	None cited	None cited	Inhalation; Dermal	Skin irritation	Suspected human carcinogen
	Cresol (all isomers)	5/5 ppm	[SKIN]	Sweet tar odor – 0.0003 ppm	Inhalation; Dermal; Ingestion	Eye, skin, and respiratory irritation; CNS depression; GI disturbances; skin and eye burns	Possible liver, kidney, and lung damage; dermatitis
	Copper (salts, dusts, and mists)	1/1 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; metal fume fever; nasal ulceration and perforation	Respiratory irritation; dermatitis; possible liver, kidney damage
	Crude Oil	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Possible CNS depression; irritation of skin and mucous membranes.	Possible dermatitis
	Cumene (isopropyl benzene)	50/50 ppm	[SKIN]	Sharp aromatic odor – 0.008 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Dermatitis
	Cyclotrimethylene-trinitramine (component of RDX)	1.5/1.5 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Headache; nausea; vomiting; amnesia; malaise; fatigue; unconsciousness	Chronic intoxication is characterization by the occurrence of repeated convulsions
	Cyclotetramethylene-tetranitramine (component of HMX)	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	None cited	None cited
	Cyanide (hydrogen cyanide)	None cited	C = 4.7 ppm or 5 mg/m^3 [SKIN]	Bitter almond odor – 0.8 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritant; chemical asphyxiant; respiratory paralysis	Possible damage to CNS, CVS, liver and kidneys

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Dibenzo-dioxins	None cited	None cited	None cited	Inhalation; Dermal	Chloracne	Highly toxic; suspected human carcinogen
	Dibenzo-furans	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Chloracne	Highly toxic; suspected human carcinogen
	DDT (dichlorodiphenyl-trichloroethane)	1,1 mg/m^3	None cited [SKIN]	None cited	Ingestion; Dermal and Inhalation are secondary	Dizziness; tremor; confusion; nausea; eye and skin irritation	CNS effects; dermatitis; kidney damage; potential human carcinogen
	Dichloro-difluoromethane (freon 12)	1000/1000 ppm	C = 6200 ppm	None cited	Inhalation; Dermal; Ingestion	CNS depression; cardiac arrhythmia	None cited
	1,1-Dichloroethane (DCA)	100/100 ppm	TLV-STEL = 250 ppm	Chloroform odor – 110 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; acute effect.
	1,2-Dichloroethane (ethylene dichloride)	1/10 ppm	STEL = 2 ppm C = 200 ppm	Sweet odor – 6 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Liver and kidney damage; dermatitis; suspected human carcinogen
	1,1-dichloroethylene (vinylidene chloride; 1,1-dichloroethene; or DCE)	1/5 ppm	TLV-STEL = 20 ppm	Sweet chloroform odor – 515 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; suspected human carcinogen
	1,2-Dichloroethylene (acetylene dichloride)	200/200 ppm	None cited	Bitter pungent odor – 0.1 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible CNS damage
	Diethyl phthalate	5/5 mg/mg^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Di-n-butyl phthalate	5/5 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis
	Dieldrin	0.25 mg/m^3	None cited	White odorless crystals	Inhalation; Dermal; Ingestion	Headache; dizziness; nausea; convulsions	Convulsions; suspected carcinogen
	Diesel Fuel	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Possible skin and respiratory irritation; CNS depression	Possible respiratory irritation; dermatitis
	Dicyclopentadiene	5/5 ppm	None cited	Sharp, sweet odor – 0.03 ppm	Inhalation; Dermal	Eye and skin irritation	None cited
	Dioxane	25/(25)	[SKIN]	Ether like odor, eye irritation, headache, nausea – 12 ppm	Inhalation; Dermal	Eye and mucous membrane irritation	Liver and kidney damage
	Denatured Ethanol (85% Ethanol) (Ethyl Alcohol)	1000/1000 ppm	None cited	Sweet alcohol odor – 47 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; dizziness; blurred vision	None cited
	Ethylbenzene	100/100 ppm	STEL = 125 ppm	Aromatic odor – 2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Dermatitis; possible CNS damage.
	Ethylene dibromide (EDB)	0.13 ppm/None cited	NIOSH REL= 0.045 ppm C = 30 ppm NIOSH C = 013 ppm [SKIN]	Mild sweet odor – 10 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Liver and kidney damage; sterilant; suspected human carcinogen; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Gasoline (total petroleum hydrocarbons)	300/300 ppm	STEL = 500 ppm	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis
	Hydrochloric acid (hydrogen chloride or muriatic acid)	5/5 ppm	C = 5 ppm	Irritating pungent odor – 5 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pulmonary edema; eye and skin burns	Dermatitis
	Hydrogen fluoride (hydrofluoric acid or fluorine)	3/3 ppm	STEL = 6 ppm TLV-C = 3 ppm	Strong irritating odor – 0.04 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns; pulmonary edema; cyanosis; delayed fever.	Fluorosis; bronchitis
	Hydrogen peroxide	1/1 ppm	None cited	Sharp irritating odor – 108 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; tremors; convulsions; pulmonary edema. Note: strong oxidizer in concentrated form.	Dermatitis
	Hydrogen sulfide	10/10 ppm	STEL = 15 ppm C = 50 ppm	Rotten egg odor – 0.0005 ppm	Inhalation	Eye and respiratory irritant; chemical asphyxiant; respiratory paralysis; olfactory desensitization	None cited
	Hydraulic oil	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Possible skin and respiratory irritation; CNS depression	Possible respiratory irritation; dermatitis
	Isopropyl alcohol	400/400 ppm	STEL = 500 ppm	Pleasant odor – 3 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible kidney damage
	Jet fuel	300/300 ppm	STEL = 500 ppm	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis
X	Lead (and inorganic lead	0.05/0.15 mg/m^3	None cited	None cited	Inhalation; Dermal;	GI disturbances; anemia; neuromuscular dysfunction;	GI disturbances; anemia; neuromuscular dysfunction; encephalopathy;

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	compounds and soaps)				Ingestion	encephalopathy	nephropathy; human carcinogen
	Manganese	5/5 mg/m^3 (0.2) (dust) 1/1mg/m^3 (fume)	C = 5 mg/m^3 (dust) STEL = 3 mg/m^3 (fume)	None cited	Inhalation; Ingestion	CNS effects; metal fume fever	Manganese psychosis; muscle weakness; incoordination
	Mercury	0.01/0.05 mg/m^3	C = 0.1 mg/m^3 STEL = 0.03 mg/m^3 [SKIN]	None cited	Inhalation; Dermal; Ingestion	Eye, skin, GI and respiratory irritation; tremors; pneumonitis	Neuromuscular and psychic disturbances; liver and kidney damage; sensitization dermatitis
	Methane	Not applicable (simple asphyxiant)	Not applicable (simple asphyxiant)	None cited	Inhalation	Asphyxiation due to displacement of oxygen; fire and explosion hazard	None cited
	Maleic anhydride	0.25/0.25 ppm	None cited	Acrid odor, double vision, asthma – 0.5 ppm	Inhalation	Severe eye irritation; asthma	Dermatitis
	Methyl ethyl ketone (MEK) (Hexone)	200/200 ppm	STEL = 300 ppm	Sweet acetone odor – 0.25 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible CNS damage
	Methyl isobutylketone (MIBK) (Hexone)	50/50 ppm	STEL = 75 ppm	Sweet sharp odor – 0.1 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and CNS damage; dermatitis
	Methyl methacrylate	100/100 ppm	None cited	Fruity, sulfidy odor, eye irritation – 49 ppb	Inhalation	Eye, skin and mucous membrane irritation	None cited
	Methylene chloride	50/50 ppm	OSHA STEL = 1000 ppm	Sweet odor – 156 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis; suspected human carcinogen
	Mineral spirits (as stoddard solvent)	100/100 ppm	None cited	Kerosene odor	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Dermatitis; possible CNS damage

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Nitrosodimethylamine	None cited	[SKIN]	None cited	Inhalation; Dermal; Ingestion	Eye irritation; CNS effects; nausea; cramps; headaches; fevers	Suspected human carcinogen; damage to liver, kidneys and lungs
	Naphtha (Stoddard Solvent or Petroleum Distillate)	100/100 ppm	None cited	Solventy odor – 0.9 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible kidney damage
	Naphthalene	10/10 ppm	STEL = 15 ppm	Tar odor – 0.3 ppm	Inhalation; Dermal; Ingestion	Eye, skin irritation; headache; nausea; abdominal pain	Damage to liver, kidneys, CNS
	Molybdenum (soluble compounds)	5/5 mg/m^3	None cited	None cited	Inhalation; Ingestion	Headache; fatigue	None cited
	Nickel (metal and insoluble compounds)	1/1 (0.05) mg/m^3	NIOSH REL = 0.015 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pneumonitis	Sensitization dermatitis ("nickel itch"); confirmed human carcinogen
	Nickel (soluble compounds)	0.1/0.1 (0.05) mg/m^3	NIOSH REL = 0.015 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pneumonitis	Sensitization dermatitis ("nickel itch"); confirmed human carcinogen
	Nitric acid	2/2 ppm	STEL = 4 ppm	Acrid, suffocating odor	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pulmonary edema; pneumonitis; eye and skin burns. Note: strong oxidizer in concentrated form.	Dermatitis
	Perchloroethylene (tetrachloroethylene; tetrachloroethene; or PCE)	25/25 ppm	C = 300 ppm TLV-STEL = 100 ppm	Chlorinated solvent odor – 5 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; skin burns	Liver and kidney damage; peripheral neuropathy; animal carcinogen

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Pentachlorophenol	0.5 mg/m^3 (skin)		Benzene-like odor	Inhalation; Dermal; Ingestion	Eye, nose and throat irritation; headache; dizziness; nausea	Chloracne; suspect carcinogen; liver, kidney damage
	Phenol	5/5 ppm	[SKIN] NIOSH REL = 0.001 mg/m^3	Sweet medicinal, odor – 0.05 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns	Possible liver and kidney damage; dermatitis
	Polychlorinated biphenyl 42% chlorine (chlorodiphenyl or PCB)	1/1 mg/m^3	[SKIN] NIOSH REL = 0.001 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin, GI and respiratory irritation; chloracne; liver injury	Liver damage; chloracne; suspected human carcinogen
	Polychlorinated biphenyl 54% chlorine (chlorodiphenyl or PCB)	0.5/0.5mg/m^3	[SKIN]	None cited	Inhalation; Dermal; Ingestion	Eye, skin, GI and respiratory irritation; chloracne; liver injury	Liver damage; chloracne; suspected human carcinogen
	Potassium hydroxide (caustic potash)	2 mg/m^3/None cited	C = 2 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns	Conjunctivitis; dermatitis; lung damage
	Phthalic anhydride	1/1 ppm	None cited	None cited	Inhalation	Eye, skin and respiratory irritation	Asthma; emphysema
	Propylene glycol	100/100 ppm	STEL = 150 ppm	Objectionable odor – 100 ppm	Inhalation	Nose, eye and throat irritation	None cited
	Silica (respirable quartz)	0.1/0.1 mg/m^3	NIOSH REL = 0.05 mg/m^3	None cited	Inhalation	Dyspnea; fever; cough; weight loss	Silicosis and respiratory illness
	Silver (metal and soluble compounds)	0.01/0.01 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; argyria of eyes, skin and mucous membrane	Argyria of eyes, skin and mucous membranes
	Sodium hydroxide (caustic soda)	2 mg/m^3 /None cited	C = 2 mg/m^3	None cited	Inhalation; Dermal;	Eye, skin and respiratory irritation; skin and eye burns;	Conjunctivitis; dermatitis; lung damage

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
					Ingestion	pneumonitis	
	Strontium-90	None cited	1.25 REM/qtr	None cited	Inhalation; Dermal	Anemia; infection; GI disturbances	Cancer; neoplasia of bone; osteosarcoma; fibro sarcomi; leukemia
	Styrene	50/50 (20) ppm	STEL = 100 (40) C = 500 [SKIN]	Solventy odor, eye irritation – 0.15 ppm	Inhalation; Dermal	Eye and mucous membrane irritation; CNS depression	Dermatitis
	Sulfuric acid	1/1 mg/m^3	STEL = 3 mg/m^3	Irritating odor – 1 mg/m^3	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns; pulmonary edema	Lung damage; dermatitis; dental erosion
	1,1,2,2-Tetrachloroethane (freon 112)	1/1 ppm	[SKIN]	Pungent, chloroform-like, sickly, sweet odor – 2.5 ppm	Inhalation; Dermal; Ingestion	Skin, GI and respiratory irritation; CNS depression; nausea	Liver damage; dermatitis; CNS effects; suspected human carcinogen
	Tetrethyl lead	0.075/0.1 mg/m^3	[SKIN]	Pleasant, sweet odor	Inhalation; Dermal; Ingestion	CNS depression; convulsions; bradycardia; eye irritation	CNS and peripheral nervous system damage; psychosis; kidney damage
	Tin (tin and inorganic compounds)	2/2 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; neurological disturbances	Stenosis; dermatitis
	Toluene	100/50 ppm	STEL = 150 ppm C = 500 ppm [SKIN]	Rubbery, mothball odor – 2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver, kidney and CNS damage; dermatitis
	1,1,1-Trichloroethane (methyl chloroform; or TCA)	350/350 ppm	STEL = 450 ppm C = 800 ppm NIOSH C = 350 ppm	Chloroform odor – 102 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; cardiac arrhythmia	Possible liver, CNS and CVS damage; dermatitis
	1,1,2-Trichloroethane	10/10 ppm	[SKIN]	None cited	Inhalation; Dermal;	Eye, skin and respiratory irritation; CNS depression	Possible liver, kidney and CNS damage; suspected human carcinogen; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
					Ingestion		
	Trichloro-trifluoroethane (freon113)	1000/1000 ppm	STEL = 1250 ppm C = 2000 ppm	Sweet odor – 45 ppm	Inhalation; Dermal; Ingestion	Eye and respiratory irritation; CNS depression; cardiac arrhythmia	Dermatitis; possible heart problems
	Trichloroethylene (TCE)	25/50 ppm	STEL = 200 ppm C = 300 ppm TLV-STEL = 100 ppm	Sweet, solventy odor – 0.2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; tremors; nausea; cardiac arrhythmia	Possible liver, kidney, cardiovascular, GI and CNS injury; suspected human carcinogen
	Tritium	None cited	1.25 REM/qtr	None cited	Inhalation; Dermal	Anemia; infection	Cancer
	Uranium (natural insoluble compounds)	0.05/0.2 mg/m^3	TLV-STEL = 0.6 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Respiratory and dermal irritation	Bone marrow depression; damage to lymphatic system; suspect carcinogen
	Uranium (natural soluble compounds)	0.2/0.2 mg/m^3	STEL = 0.6 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Respiratory and dermal irritation	Pulmonary and renal damage; bone marrow depression; damage to lymphatic system; suspect carcinogen
	Vinyl chloride	1/5 ppm	[SKIN] 15-min STEL = 5 ppm	Pleasant odor	Inhalation; Dermal; Ingestion	CNS depression; weakness; abdominal pain	Damage to lymphatic system; liver cancer; Reynauds Syndrome; vascular disturbances; confirmed human carcinogen
	Zinc Oxide dust	10/10 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation	Respiratory irritation; dermatitis
	Xylene	100/100 ppm	STEL = 150 ppm C = 300 ppm	Sweet odor – 0.1 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis; damage to CNS

PEL	=	OSHA Permissible Exposure Limit; represents the maximum allowable 8-hr. time weighted average (TWA) exposure concentration.
TLV	=	ACGIH Threshold Limit Value; represents the maximum recommended 8-hr. TWA exposure concentration.
STEL	=	OSHA Short-term Exposure Limit; represents the maximum allowable 15 minute TWA exposure concentration.
TLV-STEL	=	ACGIH Short-term Exposure Limit; represents the maximum recommended 15 minute TWA exposure concentration.
C	=	OSHA Ceiling Limit; represents the maximum exposure concentration above which an employee shall not be exposed during any period without respiratory protection.
IDLH	=	Immediately Dangerous to Life and Health; represents the concentration at which one could be exposed for 30 minutes without experiencing escape-impairing or irreversible health effects.
( )	=	ACGIH TLV Intended Change
[SKIN]	=	Indicates a significant contribution of the total exposure by the cutaneous route.
Warning	=	Represents the lowest concentration detectable in a given population. However, detection varies greatly with the individual.
REL	=	NIOSH Recommended Exposure Limit, based on a 10-hour TWA exposure

3.2 Physical Hazards

This section discusses physical hazards that may be encountered in the work environment during this project. Each or the job classifications described in Section 3.0 may be potentially exposed to one or more of these hazards. A brief description of each hazard and the appropriate personal protective equipment or control devices that should be used to prevent injury are described. The potential hazards described below are not necessarily found at each site, however, they are common to most sites.

3.2.1 Head Protection

Hard hats (ANSI-approved) are to be worn during all field activities.

3.2.2 Eye/Face Protection

Impact resistant safety glasses shall be worn as necessary to protect against airborne particles or projectiles. In addition, safety glasses shall be worn at all times at facility that require such (refinery, chemical plants, etc.). Appropriately shaded lenses shall be worn to protect against damaging rays such as those encountered during welding. If appropriate, safety goggles and face shields may be required at locations where splashing liquids may be encountered.

3.2.3 Foot Protection

Work boots with a steel reinforced toe shall be worn during all field activity. Steel reinforce shanks may be required in special situations where protection of the bottom of the foot is a concern.

3.2.4 Personal Protective Clothing

All personnel involved in field activities at the site shall wear long pants, shirt, steel toe boots, hardhats, and eye protection (when necessary).

3.2.5 Heavy Equipment Operation

EEC employees and their subcontractors must be aware of the dangers associated with heavy equipment and other vehicles onsite. These equipment and vehicles may include but are not limited to drill rigs, backhoes, loaders, and excavators. Due to the nature of these equipment, the operators vision may be compromised, therefore, all on-site personnel including the equipment operators must exercise caution. Only those individuals trained and certified in the safe operation of heavy equipment are authorized to operate such equipment.

Potential hazards are also present during the loading and unloading of such items as rolloff bins, backhoes, and loaders. These hazards include pinch and crush type injuries that can be sustained if a person is struck, pinched or pinned while the items are unloaded, or if the items break loose during unloading.

3.2.6 Equipment Failure

All equipment used onsite is to be good working order before being used onsite. Equipment is to be inspected and tested before use. The use of malfunctioning equipment is prohibited. Any malfunctioning equipment is to be tagged until repaired.

3.2.7 Underground / Aboveground Utility Lines

Forty-eight hours prior to initiation of site activity Underground Services Alert [(800) 422-4133] will be contacted prior to subsurface excavation or drilling. Additional subsurface line locating may also be required (i.e. ground penetrating radar) if site conditions warrant.

The Field Team Leader is to observe all overhead utility line locations, and inform all personnel whose equipment or vehicles may come in close proximity to these lines. Drill rigs, other vehicles, and equipment must remain a minimum of 10 feet from these utility lines. If humid conditions exist this distance may be extended.

3.2.8 Excavation / Trenching

Excavation, trenching and other earthwork shall be performed in accordance with the regulations defined in California Code of Regulations, Title 8, Article 6 of the Construction Safety Orders.

3.2.9 Confined Space Entry

All confined spaces such as tanks, trenches, and excavations are considered a confined space. Confined space will be entered only following the protocols identified in the Cal-OSHA Title 8 CCR Sections 5156-5159.

3.2.10 Protection from Moving Machinery / Parts

EEC personnel and their subcontractors will secure loose clothing, jewelry, and long hair to prevent entanglement. All unused machinery or equipment capable of movement shall be stopped and/or de-energized to prevent inadvertent movement or shock during storage, cleaning, or servicing.

3.2.11 Slips, Trips, and Falls

All employees should be aware of water, oil, machinery, mud and tools that may be present throughout the site that pose a potential slip, trip and fall hazard. All employees should assist in minimizing this potential by using good housekeeping procedures. Walkways, working areas, and roadways should be kept clear of all non-essential tools, machinery and supplies.

3.2.12 Back Injury

All employees should be extremely cautious when lifting or handling heavy materials. Back supports and proper lifting techniques should be utilized whenever possible.

3.2.13 Fire

Smoking is prohibited at all sites, unless a designated smoking area has been established. Smoking and hot work procedures are prohibited during fueling operations including those involving portable equipment. Hot work will not be performed in a potentially explosive environments until approval has been granted and a combustible gas indicator has indicated that the atmosphere is appropriate. Instrumentation used in potentially flammable locations must be rated intrinsically safe for Class I atmosphere.

3.2.14 Power Tools

All power tools must be in good working conditions prior to being used onsite. Safety glasses with side shields are required to prevent possible impact by airborne particulate and projectiles. Electrical equipment should be plugged in to ground fault interrupt (GFI) circuits whenever possible. Care should be exercise in wet environments and if equipment or extension cords become faulty. Failure to do so may result in electrocution. Any damaged or defective extension cords are to be discarded.

3.2.15 Noise

EEC employees and their subcontractors are required to carry hearing protection at all times. Hearing protection is to be worn when working in close proximity to heavy equipment or other sources of potentially damaging noise.

3.2.16 Heat Stress

At elevated temperatures or when workers are wearing personal protective equipment the potential for heat stress increases. Symptoms of heat stress are heat rashes, heat cramps, heat exhaustion and heat stoke. Early recognition of these symptoms can prevent serious illness. The following are characteristics and treatment of each illness:

Heat Rashes
Symptom: Characterized by localized red skin rash (small red pimples) and reduced sweating.
Treatment: Clean skin and let dry thoroughly after removing protective equipment.

Heat Cramps
Symptom: Characterized by muscle spasms and pain in the extremities and abdomen;
Heat exhaustion: characterized by a weak pulse; shallow breathing; pale, cool, moist skin; profuse sweating; dizziness; and fatigue.

Treatment: Rest in a cool location; provide victim sips of salted water (one teaspoon of salt in one quart of water), Gatorade©, or other electrolyte replacement fluid;

Heat Stroke

Symptom: Characterized by red, hot, dry skin; body temperature of 105°F or greater; no perspiration; nausea; dizziness and confusion; strong rapid pulse; coma; and death.

Treatment: Obtain emergency medical aid. While waiting for aid, remove as much clothing as possible, wrap victim in water soaked towels or immerse in water; apply cold packs under arms, around neck. Once victims temperature is below 102°F discontinue water immersion.

3.2.18 Sunburn

Exposure to sunlight for prolonged periods of time may cause sunburn to some individuals. All field personnel should carry sunblock with a sun protection factor (SPF) of 15 or greater, and use when appropriate.

3.2.19 Bloodborne Pathogens

Personnel administering first aid or CPR should avoid contact with blood or other potentially infectious fluids. Latex gloves and CPR mouth-to-mouth isolation devices should be utilized whenever possible.

3.2.20 Marine Safety

When performing ocean sampling all personal should be equipped with coast guard approve Personnel Floatation Devices (PFDs). Field personal should always be aware of tides, local currents and harmful sea life. Ocean sampling should always be performed by a team of two or more persons, individual sampling should never be performed. For prolonged period of ocean sampling, a wet suit should be used to reduce the risk of hypothermia.

4.0 TRAINING REQUIREMENTS

All EEC personnel and their subcontractors (except those with temporary, short-term, and sporadic visits, i.e. delivery personnel) are required to have completed all applicable training requirements as specified in Cal-OSHA Hazardous Waste and Operations (HAZWOPER) standard in Title 8, California Code of Regulations, Title 5192 and the Federal HAZWOPER) standards in the Code of Federal Regulations, Title 29, Part 1910.120.

All EEC personnel and their subcontractors (except those exempt above) will attend a project-specific training meeting for safety issues and review the project tasks before beginning work. The discussion will review the contents of the SHSP, allow all personnel to review the plan, and will require all personnel to sign the plan verifying their participation in the meeting. The meeting will be led by the Field Team Leader or Project Manager. If respirators are to be used or are anticipated to be needed during the course of the work, then fit testing of personnel may also be included in the meeting.

5.0 PERSONAL PROTECTIVE EQUIPMENT

Personal Protective Equipment (PPE) is designed to shield or isolate individuals from the chemical, physical, radiological and biological hazards that may be encountered at a hazardous waste site. PPE should be used in conjunction with, not in place of, other protective methods, such as engineering controls and safe work practices. The use of PPE itself can create significant worker hazards, such as heat stress, physical and psychological stress, impaired vision, reduced mobility, and distorted communications. For any given situation, PPE should be selected to provide an adequate level of protection. Over-protection as well as under protection can be hazardous and should be avoided.

Protective equipment is selected based on the contaminant(s) type, concentration(s) in air, water, soil, or other matrix, and known routes of entry into the human body. In situations were the type of materials, their concentrations, or exposure potential are unknown, a subjective decision regarding the assignment of PPE will be made by the HSO or Project Manager.

The U.S. EPA levels of protection are:

Level A: Worn when the highest level of respiratory, skin and eye protection is needed.

Level B: Worn when the highest level of respiratory protection is needed, but a lesser level of skin protection is needed.

Level C: Worn when the criteria for using a air-purifying respirator are met, and a lesser level of skin protection is needed.

Level D: Refers to work conducted without respiratory protection. This level should be used only when the atmosphere contains no known or suspected airborne chemical or radiological contaminants and oxygen concentrations are between 19.5% and 23%.

Level A and B PPE will not be utilized on this project at this time. If conditions warrant upgrading to Level A or B, this SHSP will be revised.

Based on available information and experience at similar sites, respiratory protection is not anticipated. Therefore the following protocols will be in effect:

1) Level D Personal Protective Equipment (in exclusion zone)
   - Hard Hat
   - Safety Glasses
   - Steel-toed boots
   - Nitrile gloves (inner)
   - Nitrile glove (outer)

2) All employees and subcontractors who have the potential for direct skin contact will be required to wear appropriate skin protection (tyvek, coveralls, nitrile gloves, etc.)

3) All workers exposed to load noises or whose predicted 8-hour time-weighted average exposure to noise equals or exceeds 85 dBA shall be provided with and wear hearing protection.

4) All workers shall be prepared to upgrade to levels C PPE. All personnel should maintain their own Level C PPE.

5.1 Level C Personal Protective Equipment

Level C PPE shall include:

- Boots or work shoes with steel toe (and shank if deemed necessary)
- Boots (neoprene with steel toe (and shank if necessary), if high direct contact exposure exists)
- Protective inner gloves (surgical nitrile, if high direct exposure exits)
- Protective outer gloves (nitrile, if high direct exposure exists)
- Protective outer gloves (leather permissible if high direct exposure does not exist)
- Coveralls, inner (fire retardant), if required
- Coveralls, outer (polyethylene-coated spunbonded polyolefin, Tyvek, or similar, if high direct contact potential exists)
- Hard hat
- Half-mask air-purifying respiratory protection with NIOSH/MSHA approved cartridges (organic vapor/HEPA, as necessary:
- Traffic vest (as necessary)

5.2 Level D Personal Protective Equipment

Level D PPE shall include:

- Boots or work shoes with steel toe (and shank if deemed necessary)
- Boots (neoprene with steel toe (and shank if necessary), if high direct contact exposure exists)
- Protective inner gloves (surgical nitrile, if high direct exposure exits)
- Protective outer gloves (nitrile, if high direct exposure exists)
- Protective outer gloves (leather permissible if high direct exposure does not exist)
- Coveralls, inner (fire retardant), if required
- Coveralls, outer (polyethylene-coated spunbonded polyolefin, Tyvek, or similar, if high direct contact potential exists)
- Hard hat
- Traffic vest (as necessary)

6.0 MEDICAL SURVEILLANCE

The medical surveillance program is a regulatory requirement designed to ensure that the health or employees working on hazardous or potentially hazardous sites is, at a minimum, monitored and documented before, during, and at the termination of work at the site. The medical surveillance requirements conform with the specifications in Title 8, California Code of Regulations, Titles 5216 and 5192; and in the Code of Federal Regulations , Title 29, Part 1910.120.

All EEC employees and their subcontractors engaged in potential hazardous waste operations must complete a preplacement or annual medical examination which includes a complete medical and occupational history, physical examination and biological monitoring. Only the employee and the HSO will have access to the medical records.

Medical surveillance will be required at the following intervals:

- Baseline or pre-placement examination
- Periodic monitoring (annual)
- Examination after illness or injury
- Termination

Medical surveillance programs are designed to provide the following information:

- Establish the baseline medical condition of employees and fitness for work
- Determine the ability to work while using protective equipment
- Track the physiological condition of employee
- Track pertinent details regarding the baseline, periodic, after-injury, and termination examinations

At a minimum the medical surveillance program will consist of:

- Complete medical and work history
- Physical examination
- Pulmonary function test
- Chest X-ray
- Eye examination
- EKG
- Audiogram
- Urinalysis
- Blood chemistry (complete blood count)
- Heavy metal screen (as appropriate)

7.0 GENERAL PROJECT SAFETY REQUIREMENTS

Project activities will be conducted in accordance with the following minimum safety requirements:

- The work area will be restricted to authorized visitors and personnel. These individual are required to attend a tailgate safety meeting prior to entering the work area. The tailgate safety meeting will discuss general project safety requirements, personal protective requirements, anticipated contaminants, and emergency response procedures. Tailgate safety meetings will be held daily, at the beginning of the work day, and attendance will be recorded. All authorized personnel must have completed HAZWOPER training.

- All personnel entering the site must check in with the Project Manager or Field Team Leader.

- Eating, drinking, chewing, and the application of makeup is restricted to the Support Zone.

- All skin contact with contaminated or potentially contaminated material or equipment should be avoided.

- Personnel should use the "Buddy System" when performing site duties. Communication should be established and maintained between team members at all times.

- All personnel entering the exclusion zone shall wear the appropriate personal protective equipment.

- A fire extinguisher shall be available for use at all times. Travel distance between fire extinguisher shall not be greater than 50 feet at any time.

- A portable eyewash station or bottle should be available onsite at all times.

- A first aid kit shall be located onsite at all times.

- During excavation or drilling, contaminated soil should be contained in drums, roll-off bins or placed on plastic lining.

- Shaking or blowing potentially contaminated clothing or equipment to remove dust or other material is prohibited.

- A warning sign which complies with the Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) shall be posted at the entrances of all work areas where one or more substances which are known by the State of California to cause cancer or reproductive harm are known or suspected to exist. That warning sign shall state:

  WARNING: This area contains a chemical known to the State of California to cause cancer or reproductive harm.

- All hazardous wastes removed from the site will be properly labeled and accompanied by appropriate papers in accordance with local, state and federal guidelines.

8.0 EXPOSURE MONITORING / AIR SAMPLING

Based on available information and experience at similar sites, it is not expected that project personnel will be exposed to substances at concentrations exceeding the PEL's or TLV's. However, all EEC personnel and their subcontractors will be dressed in Level D personnel protective equipment at a minimum, and will have Level C supplies with them at the job site at all times. The work area will be monitored using a direct-reading flame-ionization detector (FID), photo-ionization detector (PID), or direct reading combustible gas meter to detect the concentrations of volatile hydrocarbons in the ambient atmosphere. If appropriate, other methods of may be used to identify contaminants and their concentration. These methods included Drager (or equivalent) tubes, portable gas chromatographs, particulate monitoring devices, or personal sampling pumps with appropriate sampling canisters.

If the lowest TLV or PEL is encountered in the breathing zone, then appropriate personal protective equipment must be worn. Half-face respirators offer a protection factor of ten, full-face respirators offer a protection factor of 50. If concentrations exceeding 50 times the PEL or TLV are encountered, all personnel must immediately leave the site.

Direct reading instruments such as the FID or PID will be used at all sites, at regularly scheduled intervals to determine the airborne concentrations of organic compounds. The FID is generally capable of measuring airborne concentrations of many organic vapors between 0.1 and 1,000 parts per million (ppm). The PID is capable of detecting many organic vapors between 1 and 2,000 ppm. At a minimum, air monitoring will be recorded at the excavation edge and in the breathing zone. Readings will generally be recorded at 15 minute intervals during excavation of contaminated soil.

9.0 SITE CONTROL

The site control program is used to control movement of people and equipment in order to minimize worker exposure to hazardous substances or conditions. Essential to this program is the development of work zones. These work zones shall include: 1) Exclusion zone; 2) Contamination Reduction Zone; and 3) Support Zone. The work zones should be clearly identified with safety cones, flags, barrier tap or signs.

The Exclusion Zone will generally be the area immediately surrounding an excavation or drill rig. This is an area where there is a strong likelihood that contaminants will be encountered. Only essential personnel will be allowed into the Exclusion Zone. Any personnel not wearing appropriate personal protective equipment and without appropriate HAZWOPER training will not be allowed in the Exclusion or Contaminant Reduction zones.

The Contamination Reduction Zone is generally an area at one end of the Exclusion Zone where appropriate decontamination of personal protective equipment (PPE) and equipment can take place and where disposable PPE can be deposited. Where practical approximately 25-75 feet of space surrounding the Exclusion Zone will be designated as the Contamination Reduction Zone.

The Support Zone will be located outside the Contamination Reduction Zone. A rest area may be located within the Support Zone.

If the safety of the public (motorist, pedestrian, etc.) may be endangered, all work will be immediately stopped until the situation is remedied. Cones, caution tape, or warning signs will be used when necessary to redirect pedestrian or motor traffic.

10.0 DECONTAMINATION

To prevent or reduce the transfer of contaminants by people and/or equipment leaving the Exclusion Zone, decontamination measures will be implemented. These decontamination measures include:

- Dispose of boot covers, or use a brush to remove all foreign material from boots;
- Remove outer gloves, dispose or wash gloves;
- Remove protective clothing, dispose if appropriate;
- Wash respirator bodies in warm water, dispose of cartridges;
- Remove inner gloves, wash hands and face thoroughly with soap and water, remove work clothes and shower as soon as possible;
- Brush or wash all equipment that was within the exclusion zone;
- Dispose of all decontamination equipment (brushes, sponges, etc.) and disposal personal protective gear into an appropriate container.

11.0 EMERGENCY RESPONSE / CONTINGENCY PLANS

All personnel will be trained in the proper response to emergency response / contingency plans. In the event of a fire, explosion or other emergency condition requiring evacuation, all employees will proceed to the nearest upwind collection area. Decontamination procedures will be abandoned in the case of evacuation. The project manager, field team leader, or any other field personnel shall contact the appropriate fire or response agency. After emergency response personnel are contacted, the field personnel shall also contact EEC management and the pertinent client contact. Phone numbers of appropriate emergency response personnel, EEC management, and client contact are shown on the following page.

In the event that a worker must be transported to a hospital or other medical facility, the Project Manager, Field Team Leader or other appropriate personnel shall ensure that the chemical contaminant information is provided to the medical facility personnel (if pertinent to the injury). The emergency care facility located closest to the site is discussed on the following page.

Emergency and non-emergency accidents/injuries will be documented by the Project Manager or other management personnel in accordance with applicable rules and regulations.

11.1 General First Aid Guidelines

The following is general guidelines to follow in the event of an accident or injury.

Inhalation Exposure:	Remove victim to fresh air, give rescue breathing or CPR as necessary. Decontaminate and transport to emergency hospital if necessary.
Skin/Eye Contact:	Remove contaminated clothing, flush affected area with copious amounts of water for at least 15 minutes; if eyes are affected, hold eyelids open to assure adequate flushing. Decontaminate and transport to emergency hospital, if necessary.
Ingestion:	Decontaminate and transport to emergency hospital
Puncture/Laceration:	Decontaminate and transport to emergency hospital

11.2 Emergency Hospital Directions (attached map, Appendix B)

Emergency Hospital Directions	
Hospital:	Arrowhead Regional Medical Center (~ 2.72 miles, 6 minutes) from the Site)
Phone Number:	(909) 580-1000
Address:	400 North Pepper Avenue, Colton, California 92324
Directions:	1. From the site, head north on Congress Street (towards South 8th Street); 2. Turn RIGHT on South 8th Street (0.29 miles); 3. Turn LEFT on East O Street (59 feet); 4. Turn RIGHT on South 8th Street (335 feet); 5. Bear RIGHT on South La Cadena Drive (0.38 miles); 6. Turn LEFT to take ramp onto I-10 WEST towards Los Angeles (1.44 miles); 7. Take exite #69/Pepper Avenue (0.23 miles); 8. Turn RIGHT on North pepper Avenue (0.17 miles); and 9. Arrive at Arrowhead Regional Medical Center on RIGHT.

11.3 Emergency Telephone Numbers

EMERGENCY TELEPHONE NUMBERS	
Arrowhead Regional Medical Center	**(909) 580-1000**
Ambulance/Paramedics/Fire Department	**911**
Police	**911**
Poison Control Center	**1-(800) 876-4766**
National Response Center	**(800) 424-8802**
Chemical Transportation Emergency Center Chemtrec (24 hours)	**(800) 424-9300**
EEC - Mark Zeko **(pager)** **(mobile)**	**(714) 667-2303** **(714) 358-9249** **(714) 814-2174**
EEC - John Shaffer **(pager)** **(mobile)**	**(714) 667-2302** **(714) 358-9248** **(714) 814-2173**
Occupational Safety and Health Admin. (OSHA)	**(213) 861-9993**

12.0 RECORD KEEPING

Records shall be kept in accordance with all Federal and State guidelines. The following records for EEC employees will be maintained at the office:

- Hazard Communication and Hazardous Waste Site Training
- Respiratory Protection Training (and annual fit testing certificate)
- Respirator Assignment
- Medical Surveillance
- Site Safety Inspections
- Personal Monitoring Records (if applicable)
- Accident and OSHA Logs

The following records will be maintained at the site (if appropriate):

- Site Entry Log/ Visitor Log
- Worker illness/injury reports
- Work Plan
- Site Health and Safety Plan
- Site Safety Inspection Reports
- Sampling activities
- Daily Field Reports
- Chain of Custody forms
- Tailgate Safety Meeting Forms

EEC's subcontractors will be responsible for maintaining their employee records in a manner consistent with the applicable regulations.

13.0 SHSP IMPLEMENTATION AND SIGNATURE PAGE

The following EEC personnel have reviewed this Site Health and Safety Plan:

Title	Name	Signature	Date
Health and Safety Officer	Mark Zeko		
Project Manager	Dave Bernier		
Field Team Leader			
Team Members			
Subcontractors			

APPENDIX A
PEL/TLV DEFINITIONS

Permissible Exposure Limits

Permissible Exposure Limit (PEL) is a persons permitted exposure to any material listed in Table Z-1, Z-2, or Z-3 of OSHA Regulations found in 29 CFR 1910.1000, Air Contaminants and in the State of California Department of Industrial Relations, Division of Occupational Safety and Health (Cal-OSHA), in California Code of Regulations (CCR), Title 8, General Industry Safety Orders, Section 5155 and other sections. If PEL's for a compound differ between state and federal requirements, the more stringent requirement is utilized. PEL's generally represent time-weighted average values based on a 8-hour work day, 40 hours per week. Another commonly used exposure limit is the Short Term Exposure Limit (STEL) values which, generally, represent limits not to be exceeded for time periods longer than 15 minutes. Some substances have also been assigned a ceiling limit © which is a value not to be exceeded at any time during a work shift. Exposure to certain substances can be enhanced by contact with skin, mucous membranes and/or eye contact. These substances are designated with the notation "Skin".

Threshold Limit Value / Time-Weighted Average (TLV-TWA)

The time-weighted average concentration of a airborne substance over a normal 8-hour workday and a 40-hour workweek to which nearly all workers may be repeatedly exposed, day after day, for a 40 year working lifetime without adverse affects. The TLVs listed in this SHSP are recommended by the American Conference of Governmental Industrial Hygienists (ACGIH). TLVs are based on the available information, from industrial experience, human and animal studies, and when possible a combination of the three sources. TLV's are generally expressed as 8-hour time-weighted averages (TLV-TWA). However they can also be expressed as short term exposure limits (TLV-STEL), ceiling values (TLV-C), and have carry special notations regarding enhanced exposure do to contact with skin.

FINAL ENVIRONMENTAL IMPACT REPORT (EIR) FOR SOIL SAFE LAND IMPROVEMENT PROJECT, CITY OF COLTON, SAN BERNARDINO COUNTY

Dear Mr. Tomich:

We have reviewed the Final EIR document dated February 24, 2011 for the Soil Safe Landfill Improvement Project, which we received on February 25, 2011. The proposed project includes grading and filling a 29-acre site with non-hazardous treated soils in order to raise the site's elevation above the flood plain of the Santa Ana River. The treatment process consists of mixing non-hazardous soils with Portland cement to physically fix any potential contaminates. The site is located southwest of the intersection of Interstates 10 and 215 in the City of Colton. The engineered soil will consist of imported soil meeting self-imposed quality limits, which are set at or below all regulatory thresholds and will be modified on site by processing with Portland cement. The modified soil will then be placed and compacted over the entire site. Potential projects to be developed on the raised site may include 400,000 square feet of light industrial use, the extension of Fogg Street, and the realignment of the Union Pacific rail line.

Based on our review of the Final EIR, Board staff finds that the proposed project should not pose a threat to water quality or the environment provided that the project meets all Applicable or Relevant and Appropriate Requirements (ARAR) and regulatory thresholds for soil placement at the project site, especially the requirements for total lead, copper, and nickel concentrations, as amended by Section 25157.8 (a) of the Public Health and Safety Code, which prohibits the disposal of waste containing total lead in excess of 350 parts per million (ppm), copper in excess of 2500 ppm, and nickel in excess of 2000 ppm to any location other than a Class I hazardous waste site. The project proponents shall ensure that soil disposed of at the site is consistent with the above-referenced Health and Safety Code.

If you have any questions regarding this letter, please do not hesitate to contact me at (951) 782-4997.

Sincerely,

Keith Person

CITY OF COLTON
Development Services Department
Memorandum

Date: September 6, 2012

To: Rod Foster, City Manager

From: Mark Tomich, Development Services Director

Subject: Guyaux Landfill Update

This is to update you, the Mayor and Council Members on our research regarding efforts to address contamination issues at the Guyaux Landfill.

Landownership Issues

Staff has talked with the (former) property owner, Mike Griffin, in the attempt to secure his cooperation in the landfill cleanup. We have also inquired about his willingness to donate the property to the City. Although Mr. Griffin has indicated his willingness to cooperate on clean-up activities, he would want to include the Riverside Utility in any clean-up discussions. For City- or grant-funded clean-up to occur, a cooperative agreement would need to be negotiated between the landowner and the City. Mr. Griffin is not interested in donating the property to the City, but is willing to negotiate a sale of the property, assuming that he still has control of the property.

Any movement toward negotiating a cooperative agreement for cleanup of the property or purchase of the property is complicated by the fact that the property is in receivership. At this stage, the bank and other creditors have not reached the stage where they can enter into any cooperative agreement or sell the property. We are continuing to monitor the receivership process and provide an update when title to the property is no longer clouded.

Level of Contamination and Health Risk

Based on my discussions with Santa Ana Region Water Quality Control Board staff, and comments from two environmental engineers who have reviewed existing studies, there is minimal health risk to nearby residents from exposure to the landfill. However, there is a possibility of long-term impacts on groundwater quality from continued leaching of rain/runoff through the landfill.

Soils studies conducted in 1997 (to a depth of 6-inches to 1-foot), determined that levels of lead exceeded federal standards at several “hot spots.” However, limited soils testing conducted by Soil Safe in 2010 did not find lead levels that meet hazardous thresholds. Soil Safe also installed five groundwater testing wells at the landfill. The wells found some traces of volatile organic compounds (VOC), but not at hazardous levels, and no discernable impacts on

groundwater. However, electrical conductivity tests (a means to determine elevated levels of salts) concluded that salts slightly exceed federal drinking water standards.

Santa Ana Region Water Quality Control Board staff has informed me that, although they would like to see the landfill capped, they would not take any action to force the City (or landowner) to cap the site unless contamination leaks into the Santa Ana Groundwater Basin. The local enforcement agency (LEA) is the San Bernardino County Health Department/Environmental Health.

Actions to Address Contamination

Water Board staff recommends the following remedial actions:

1. Conduct review of existing studies/documentation regarding Guyaux Landfill.
2. Investigate soils "hot spots" (identified in 1997 study) to determine current contamination levels. If any hot spots continue to exist, prepare a remediation ("hot spot removal") plan.
3. Design and install drainage improvements to move runoff around the landfill.
4. Cover landfill (preferred) with topsoil or other cover. This will minimize water infiltration and improve drainage.

I have also contacted two environmental engineering firms (SWT Engineering and BAS Associates) for their informal assessment of what remediation activities need to occur, including the range of costs. The range of costs includes the following:

- Review of existing documentation/studies: Approximately $10,000
- Onsite soils testing and wells, if necessary: $20,000 to $40,000
- Hot spot removal: $25,000 to $50,000
  Note: Both firms recommended "cap in place" rather than removal of hot spots.
- Soil cover (1-foot depth, 4 acres): $170,000 to $200,000 (including importing of soil)
- Drainage: $15,000 to $30,000

Overall clean-up costs would range from $240,000 to $330,000.[1]

Liability Concerns

According to input from the City Attorney, the City would incur no liability if we take no action to clean up the landfill. This assumes that the City had no control over the operation of the landfill during its history.

If the City hires a contractor and/or directs a contractor to perform any level of clean-up at the site, the City would be exposed to increased liability. This could be minimized by:

- Paying for the clean-up, with the landowner taking responsibility for hiring the contractor, directing the work, and submitting any reports to the Water Board and DTSC; and
- Entering into an agreement with the property owner, whereas the property owner absolves the City from any liability in exchange for the funds to perform the work.

[1] Mr. Griffin has received a cleanup quote of $6.2 million.

Funding Options

A CalRecycle AB 2136 “Solid Waste Disposal and Codisposal Site Cleanup Program” grant appears to be the sole source of funds currently available for clean-up purposes. This grant reimburses cities up to $500,000 funds for cleanup of solid waste at sites where the responsible party either cannot be identified or is unwilling or unable to pay for remediation, and where the cleanup is needed to protect public health and safety and/or the environment. If the City does not secure ownership of the property, a cooperative agreement would need to be negotiated with the landowner.

According to the CalRecycle grant contact-person, the City would need to develop a detailed clean-up plan in advance of applying for the grant in order for the application to be competitive. Therefore, I anticipate that the City would need to spend $15,000-$25,000 to review existing documentation, conduct any necessary soils studies, and prepare a clean-up plan. Because cleanup of the landfill is a City Council priority, staff is looking for unencumbered funds that could be used for this purpose. The City’s expenses could be recovered through a lien placed on the property, with City Council authorization.

Please let me know if you have any questions or desire further actions regarding clean-up of the Guyaux Landfill.

Subject: Work Plan for Phase II Environmental Site Assessment
Guyaux Waste Disposal Site
Terminus of South Florez and South Fernando Streets
Colton, California
SWIS No. No. 36-CR-0025

Dear Mr. Martin:

Ninyo & Moore is pleased to submit this work plan providing information related to conducting a Phase II Environmental Site Assessment (ESA) at a portion of the proposed Colton Regional Soccer Complex Redevelopment project in Colton, California. More specifically, this work plan pertains to an approximately 4 acre portion of the redevelopment project referred to as the Guyaux Landfill. The plan presents procedures for conducting the Phase II ESA that will evaluate the locations, types, and extent of wastes related to the waste disposal site. This plan was prepared in general accordance with applicable regulatory guidelines and regulations.

We appreciate the opportunity to work with you on this project.

Respectfully submitted,
NINYO & MOORE

1. INTRODUCTION

The City of Colton (City) is proposing to construct a 34.5-acre regional soccer complex approximately 34.5 acres. The proposed park is accessible from Congress Street and will be located adjacent to and north of the Santa Ana River. An approximately 4-acre northern portion of the property consists of a waste disposal site referred to as the Guyaux Landfill (herein after referred to as the Guyaux Waste Disposal Site [WDS] or "site"). Background information indicates that the WDS was historically used for waste disposal of construction debris such as used bricks, concrete, iron waste (slag), plaster molds, rubber, steel, wood, and other deleterious materials (Bechtel, 1996). The WDS is located immediately south of the termination of South Florez and Fernando Streets in the City of Colton, San Bernardino County, California (Figure 1).

The Guyaux WDS is identified in the California Department of Resources, Recycling and Recovery (CalRecycle) Solid Waste Information System (SWIS) database and is assigned No. 36-CR-0025. Based on information contained in the SWIS database, the site is a pre-regulations, closed waste disposal site that reportedly ceased operations in December 1985. Waste types are listed as industrial, inert and metals (Appendix A).

The City requested a work plan be prepared to conduct a Phase II Environmental Site Assessment (ESA) at the WDS to characterize and delineate the lateral and vertical extent of the wastes, including additional investigation of previously identified "hot spot" areas of "soil" containing elevated lead concentrations (EEC, 2010). This work plan describes the procedures to conduct the Phase II ESA at the site.

This work plan and the results of the Phase II ESA will be used to assist with evaluating whether the WDS can be capped/covered so the City can construct the soccer complex and community park. This work plan summarizes the available history of the WDS and presents procedures for conducting the Phase II ESA intended to evaluate the types and extents of wastes disposed of at the site as well as the potential presence and thickness of cover, if present.

2. PROJECT OBJECTIVES

The Guyaux WDS is a roughly circular-shaped plateau and south-southeast and east facing waste fill slope extending from the southern terminus of South Florez and South Fernando Streets (Figure 2). Although not known, aerial photographs suggest that wastes may underlie residential properties at the southern portions of these two streets. The residential properties are located outside the "site" as defined in this investigation. Background information was not available pertaining to whether wastes were encountered during construction of several relatively recently constructed residences, including two located on the east side and southernmost extent of South Florez Street (Figure 3A). However, during the April 26, 2016 site reconnaissance, several piles of what appeared to be relatively recent waste debris and soils located in close proximity to the residences was observed and may have been related to residential construction (Figures 3A, 3B and 3C; Appendix B). Documentation was not available at the time of this work plan related to whether wastes, if encountered, were removed or partially removed during construction of the residential homes at the end of South Florez and South Fernando Streets. It is likely that if wastes were encountered, that only those affected by the construction were disturbed/possibly moved to accommodate residential construction related activities.

The primary objectives of the Phase II ESA are as follows:

- Delineate the lateral and vertical extent of the wastes, thicknesses, and chemical characteristics.
- Provide an estimate of the in-place volume of wastes based on locations explored.
- Conduct sufficient analytical testing to generally pre-characterize the wastes if planned remedial action involves offsite disposal of the wastes.
- Evaluate the potential presence, thicknesses, and quality of the cover material.

The information obtained from the Phase II ESA will assist with developing an appropriate remedial action for the WDS. The proposed Phase II ESA activities will be conducted in general accordance with this work plan, applicable regulatory requirements and guidance documents and requests by CalRecycle and/or the Local Enforcement Agency (LEA).

3. SITE LOCATION AND DESCRIPTION

The approximately 4 acre site corresponds to the assumed extent of suspected waste disposal and is located in a mixed industrial area to the west, and residential area to the north in the area of South Florez and South Fernando Streets, in Colton, California. The site is readily accessible via South Florez and South Fernando Streets and is located within and/or immediately north of the Santa Ana River. Recent topographic map and survey data provided by PBLA Engineering (Appendix A) indicates that the top of the WDS area is at an elevation of approximately 929 to 933 feet above mean sea level (MSL) (PBLA Engineering, 2016).The slope face of the WDS, adjacent to undeveloped property to the south and the east, is approximately 10 to 12 feet higher. However, the highest elevation on the landfill is approximately 15 feet higher than the adjacent natural ground. The location of the site is shown in Figure 2. The City property (34.5 acres) which includes the approximately 4-acre WDS, consists of three undeveloped, vacant parcels, totaling approximately 30.5 acres. These parcels, zoned as open space, are as follows:

- Assessor's Parcel Number 0163-362-26, consisting of 13 acres.
- Assessor's Parcel Number 0163-381-01, consisting of 6.5 acres.
- Assessor's Parcel Number 0163-381-02, consisting of 11 acres.

An unpaved dirt road generally delineates the south and east perimeter of the WDS. The waste disposal site is accessible by foot at the termination of South Florez and South Fernando Streets with no perimeter fence line except for a gate at South Florez Street which was unlocked. Overhead utility lines transect the City property and are generally oriented east to west near the base of the waste disposal area, then continue northeast across the property. Dirt roads and natural drainage channels meander through the undeveloped property and generally bound the south and east sides of the WDS. An unlocked monitoring well was observed at the base of the WDS on the south and three locked or abandoned monitoring wells were observed at various locations at the site (Figure 4).

During an April 26, 2016 reconnaissance of the site, wastes/debris, including concrete, bricks, wood, and slag were visible on the waste disposal area surface and along the waste slopes of the southern and eastern descending slopes. The surface and slope faces of the WDS were

characterized by erosional gullies and numerous rodent burrows. At the time of our site visit, two new homes were in construction at the northern boundary of the waste disposal site. Relatively large piles of concrete and brick debris, up to approximately 7 feet high were observed off site and east (behind) of the southernmost new residence and assumed to be associated with their constructions. Photographs from the April 26, 2016, site reconnaissance are included as Appendix B.

The site is bordered to the west by an industrial property and railroad tracks; to the north by residential properties; and to the east and south by the flood plain and the Santa Ana River.

4. OWNERSHIP AND OPERATORS

The following information for the WDS was obtained from SWIS database and City of Colton:

Site:	Guyaux Landfill
Location:	At the end of South Florez & South Fernando Streets, Colton CA
GIS Coordinates:	34.05368; 117.322178 (CalRecycle SWIS Database)
SWIS No.:	36-CR-0025
Elevation:	929-933 feet above MSL
Operator:	no information provided
Contact:	Ms. Deb Farrar, CPRP, Acting Director of Community Services
Land Owner:	Mr. Ralph Guyaux (CalRecycle, SWIS database)
Current Land Owner:	City of Colton, Development Services Department

5. BACKGROUND AND SITE HISTORY

According to a 1993 interview with the site owner, Mr. Ralph Guyaux, by Roy F. Weston, Inc. (Weston) as part of their Preliminary Assessment (PA) Report for the United States Environmental Protection Agency (EPA), the site was used in the late 1930s for disposal of construction debris generated from the flooding of the city of Colton in 1938. In the late 1950s, the site was used to

store used bricks which were then cleaned and re-sold for construction activities. The waste products generated from the used brick cleaning were used as fill on the site (Weston, 1993).

Background information indicated that in 1966, the site was purchased by Mr. Robert Zandberen from Mr. Henry Adams. In 1973, Mr. Ralph Guyaux began a "20-year purchase" of the property, which previously had an agreement with Crane Company to accept plaster molds from the production of bathroom fixtures and broken porcelain (start date of waste acceptance not reported). In 1977, the site began to accept "black slag" from the Griffin Wheel Company (Weston, 1993).

According to a letter from the Santa Ana Regional Water Quality Control Board (RWQCB) addressed to Mr. Guyaux and dated November 16, 1977, the RWQCB analyzed a leachate sample of the molding material from the Crane Company, found the material to be "significantly soluble in water," and requested that Mr. Guyaux not accept further wastes from the Crane Company. The RWQCB also requested that waste should not be accepted from the Griffin Wheel Company under the assumption that a leachate analysis of the "black ash material" (slag) would "also have similar results." The RWQCB requested that the "black ash material" be analyzed and a Waste Discharge Report be submitted.

In a letter to the RWQCB dated January 27 1978, Mr. Guyaux submitted a partially completed Waste Discharge Report (dated December 29, 1977) and indicated Colton Manufacturing (Crane Company) had been notified that molds and fixtures were no longer permitted to be disposed of at the site. Mr. Guyaux also indicated black ash material from Griffin Wheel had not been disposed of at the site for six months and that he had collected a sample of the material for analysis. In 1981, Mr. Guyaux indicated the "ash material" analytical results were either never reported or lost. However, according to an interview conducted by Weston as part of their PA in 1993, Mr. Guyaux stated he never collected a waste sample because the RWQCB wouldn't issue him a permit to operate the landfill. He also indicated the site stopped accepting wastes in 1981 when directed to do so by the RWQCB, however Weston reported waste disposal ceased by 1985.

Bechtel (1996) stated that in the 1970s and 1980s, the WDS was used as a materials recycling disposal yard for waste materials generate at the Griffin Wheel Company and the Crane 'Company.

Materials disposed of on site included construction debris, plaster molds, broken porcelain, and waste foundry slag. Reportedly, these materials apparently were disposed of on exposed soil. Steel and wood beams were also stored on the site for reuse until the mid-1980s (Weston, 1993). From approximately 1985 to the mid-1990s, the site was used to temporarily store automobiles and machinery prior to reuse (EEC, 2010).

In 1985, the RWQCB requested a groundwater monitoring program for the WDS and in 1988, a Solid Waste Assessment Test. Mr. Guyaux did not comply with these requests. In the interview, Mr. Guyaux also stated that the waste slag from Griffin Wheel Company consisted of "a few loads," was not used as fill, and was left in visible piles on the surface of the site. Weston reported that they observed approximately 10 piles of solid waste material (slag) from Griffin Wheel Company during their site reconnaissance. Weston indicated "it is unknown if any of this material was also buried at the site and there are no records indicating how long these materials were deposited at the site, or in what quantities (Weston, 1993).

Previous investigations indicated that the WDS may have been regraded sometime in the mid-1990s indicating that the actual vertical extent of the WDS may extend beyond the limits shown on Figure 3A.

6. HISTORICAL AERIAL PHOTOGRAPH AND TOPOGRAPHIC MAP REVIEW

Historical aerial photographs dating from 1938 through 2012 and historical topographic maps dating from 1896 through 2012 were reviewed to obtain background information about the WDS (Appendix C). The summary below is an interpretation of the photographs and is focused on information that may be relevant to the subject planned Phase II ESA related to the WDS and is not intended to be a complete description of all historical site conditions. Although off site, an objective of the historical aerial photograph review was to identify whether wastes may underlie residential properties located at the southernmost extent of South Florez and South Fernando Streets.

1938 Aerial Photograph – The 1938 photograph indicates the site as undeveloped land. The flooded Santa Ana River, trending northeast to southwest has inundated the majority of the site.

Some agricultural and residential properties are located north-northwest of the site. North to south trending, unpaved, South Florez and South Fernando Streets appear as dirt roads to the adjacent north of the site. The Southern Pacific railroad tracks are located west of the site.

1949 Aerial Photograph – The site remains undeveloped in the 1949 aerial photograph. The Santa Ana River appears dry; however the site still shows the effects of being inundated by the river. Trees and other vegetation delineate the northwestern extent of the flooded area. Additional residential properties appear to the north of the site at the terminus of unpaved South Florez and South Fernando Streets.

1953 Aerial Photograph – The site continues to be undeveloped in the 1953 aerial photograph. The northwestern portion of the site appears to contain increased vegetation and the southwestern extent appears to remain as a dry riverbed area. Additional residential properties are located along S Florez and South Fernando Streets, with several homes located south of the terminus of these unpaved streets.

1959 Aerial Photograph – The site remains undeveloped. A stream/river related to the Santa Ana River Channel traverses the site from northeast to southwest at the southern portion of the site. Some fill material appears to extend from off site onto the northwestern most corner of the site and stockpiled material appear to be located near the terminus of South Florez Street on the east side and at the current location of off site residential properties. Although not clear, there appears to be some surface disturbances at the northeastern site area, south of the terminus of South Fernando Street.

1966 Aerial Photograph – The 1966 aerial photograph is grainy with poor resolution. Areas at the terminus of unpaved South Florez Street appear to be disturbed. The orientation of the stream/river associated with the Santa Ana River channel has changed and it trends close to the northern site boundary.

1968 Aerial Photograph – In the 1968 photograph, there is a circular-shaped area of darker soil at the northwest portion of the site that also extends off site to the north. Near the northern property boundary is a dumping area, lighter colored and what appears to be a truck actively dumping. (The

northern property boundary on the historical aerial photograph was slightly moved north to show this feature.) The circular/elliptical shaped feature suggests dumping from the north creating a waste slope to the south-southeast and east. Vehicles are located north of the site, near the terminus of South Florez Street and may or may not be related to dumping or could be associated with residential properties (see also Figure 3A).

1975 Aerial Photograph – This infrared photograph is poor resolution; however, the roughly circular areas shows lighter colored areas, likely related to dumped materials. The lateral extent of the dump appears to have expanded (see Figure 3B). Several dirt paths appear leading to and from the waste disposal area. As in the previous photograph, although not entirely clear, it appears that wastes extend off site to the north at locations of residential properties.

1985, 1989 Aerial Photographs – The 1985 and 1989 aerial photographs show evidence of dumping at the site. A looping dirt road extending from South Florez Street appears to be located on wastes appears at the central portion of the site. The road likely was used by trucks to access the dump area and circle back up to South Florez Street. Debris is visible on the slope areas of the waste disposal area.

1995 Aerial Photograph – In the 1995 aerial photograph, the looping dirt road assumed to be related to waste disposal is no longer present. Areas of what appear to be surficial wastes are visible at the south, southeastern and eastern portion of the site, likely related to dumping further north. Off site areas to the adjacent north of the site, near the terminus of South Florez Street (west and east sides) that are the future locations of residential properties; appear similar in appearance to the northern waste disposal area and could be related to grading of the site/offsite areas. (Background information indicates the site was graded in 1995). Several dirt roads are visible around the site and within the project area.

2005, 2006, 2009, 2010, 2012, 2014 and 2016 Aerial Photographs – The 2005 through 2016 aerial photographs indicate the site generally similar to current conditions. Changes in the area are generally related to residential development to the north, some of which may be on portions of the waste disposal site. By 2005, the WDS area shows increased vegetation. Some areas of what

appear to be surficial wastes are visible on the slopes of the waste disposal area. To the adjacent north and on the west side of South Florez Street are recently constructed residential properties. By 2005, a lumber company is located west of the site. By 2009, an additional residence has been constructed on the west side of South Florez Street, adjacent to the site and the paved road has been extended south. In 2010, a residence is being constructed on the west side of South Fernando Street at the terminus of the street. The residential lots on the east side of the terminus of South Florez Street remain undeveloped; however by 2012, the northern area appears to be graded. The 2016 aerial photograph indicates two recently constructed residential properties on the east side of South Florez Street, near the terminus. Stockpiles of debris that due to their locations appear to be related to the recent residential constructions are located to the east and south. During the site reconnaissance the stockpiles appeared to consist of construction related debris such as bricks, concrete slabs, and cinder blocks (Appendix C).

Historical topographic maps from 1896 through 2012 showed the site as undeveloped land. Indications of landfill activities were not observed in the historical topographic maps. The Santa Ana River is shown to the east and south of the site. In the 1938 topographic map, the Riverside Canal (Aqueduct) is shown south-southeast of the site. In the 1954 topographic map, a recreational park and school are located north and west of the site, respectively. Also, three groundwater water wells are located south of the site and adjacent to the Santa Ana River. The Union Pacific Railroad tracks are present to the west of the site. Residential homes are visible along South Florez and South Fernando Streets. Area south of the site consisted of undeveloped vacant land.

7. TOPOGRAPHY, GEOLOGY, AND HYDROGEOLOGY

The following sections provide general information on the topography, geology and hydrogeology at the site and vicinity based on review of available maps and other publications.

7.1. Topography

Based on review of the United States Geological Survey (USGS), 7.5-Minute Topographic Quadrangle Map Series, San Bernardino South, California, 1967 (rev 1980), the site is located in Township 1 South, Range 4 West, of the San Bernardino Base and Meridian.

According to a recent land survey conducted by PBLA Engineering (Appendix A), the upper area of the WDS is at an elevation of approximately 929 to 933 feet above MSL. The slope face of the WDS, adjacent undeveloped property to the south and the east, is approximately 10 to 12 feet high. However, the highest elevation on the WDS is approximately 15 feet higher than the adjacent surrounding natural ground. The surface runoff flow direction is towards the southwest based on topography.

7.2. Geology

The site is located in the Peninsular Ranges Geomorphic Province of California, in the central portion of the Perris Block, which is a relatively stable structural block located between the San Jacinto Fault Zone to the northeast, the Elsinore Fault Zone to the west and the Cucamonga Fault Zone to the north. In general, the Perris Block is a rectangular shaped block, with low relief consisting of Quaternary to Pleistocene aged alluvium of the Santa Ana River that fills the basin estimated to be approximately 1,200 feet thick (USGS, 2006).

The predominant rock type that underlies the Peninsular Ranges province is a Cretaceous-age igneous rock (granitic rock) referred to as the Southern California batholith. Older Jurassic-age metavolcanic and metasedimentary rocks and older Paleozoic limestone, altered schist, and gneiss are present within the province. Cretaceous-age marine sedimentary rocks and younger Tertiary-age rocks comprised of volcanic, marine, and non-marine sediments overlie the older rocks (Norris and Webb, 1990). More recent Quaternary sediments, primarily of alluvial origin, comprise the low-lying valley and drainage areas within the region, including the area where the site is located.

This alluvium overlies Paleozoic metamorphic bedrock and Cretaceous granitic bedrock. There are no active faults at the site; however, the northwest-southwest trending Rialto-Colton fault is located approximately 1 mile to the northeast of the site. The nearest Alquist-Priolo Earthquake Fault Zone is the northwest trending San Jacinto fault zone located approximately 2 miles northeast of the site (USGS, 2006).

Based on a review of the USGS Geologic Map of the San Bernardino South 15' Quadrangle, San Bernardino, County (USGS, 1966), the site is mapped as young alluvial fan deposits of late Holocene age, consisting of coarse sand to boulder alluvium of modern fan deposits (USGS, 2006).

7.3. Hydrogeology

This site is located in the Upper Santa Ana Valley Groundwater Basin near the boundary of the Rialto-Colton, Bunker Hill and San Timoteo Groundwater Subbasins of the Upper Santa Ana River Hydrologic Area (DWR, 2006). Based on information included in the DWR, the subbasins consist of alluvial materials that underlie the San Bernardino Valley. The aquifers of the Upper Santa Ana Valley Groundwater Basin are generally unconfined and comprise several subbasins filled with alluvial deposits eroded from the surrounding mountains. The thickness of these deposits ranges from less than 200 ft to more than 1,000 ft. Faults play an important role in the groundwater flow system. Approximately 0.5 miles to the east of the site, the San Jacinto Fault divides the Upper Santa Ana Valley Groundwater Basin into its subbasins. The San Jacinto Fault acts as a barrier to the westward movement of groundwater in the older alluvium but does not affect groundwater movement in the unfaulted, younger alluvium and river channel deposits (DWR, 2006).

According to an Expanded Site Inspection (ESI) document by Bechtel, a 1989 hydrogeological study conducted by the Santa Ana Watershed Project Authority in the site vicinity indicated a perched groundwater table from approximately 40 to 80 feet below the ground surface (Bechtel, 1996). Additionally, a work plan for lead remediation of several isolated areas of the WDS prepared by Environmental Engineering and Contracting, Inc. (EEC, 2010), indicates four groundwater monitoring wells were installed in the vicinity of the site in 2009. The depth to groundwater in these wells at that time was reported to range from approximately 85 to 94 feet below ground surface (bgs). During Ninyo & Moore's site reconnaissance conducted on April 26, 2016, the depth to groundwater measured in a well located at the base of the southern limits of the landfill was approximately 92.5 feet bgs.

8. PREVIOUS INVESTIGATIONS

This section summarizes available previous information related to the Guyaux Landfill relevant to the subject Phase II ESA. Previous investigation documents are included in Appendix A.

Technical Memorandum No. 2B, Santa Ana Watershed Project Authority (SAWPA), Rapid Infiltration/Extraction (RIX) Demonstration Project, Site 2 Hydrogeological Investigation, SAWPA, December 21, 1989

In 1989, the SAWPA conducted a hydrogeological investigation of a 110-acre area (including the site) for a potential RIX facility. As part of the investigation, three groundwater monitoring/extraction wells were installed in the area of "Site 2" (also identified as the "Demo Site"), which included the site. Analytical results from the groundwater wells indicated concentrations of tetrachloroethylene (PCE) ranging from 7 to 17 micrograms per liter (µg/L) and arsenic up to 18 parts per billion. Based on this information and other factors, SAWPA abandoned Site 2 as a potential RIX facility.

Preliminary Assessment Report, Guyaux Landfill, (EPA ID No. CAD983652033), Weston, June 9, 1993.

In 1993, Weston observed wood, concrete, asphalt, bricks, old tires, mattresses, household refuse, furniture, pieces of steel and metal, car and truck frames, empty drums, car fuel tanks, telephone poles, and a crushed fuel tank (approximately 500 gallons) on the property. Weston identified the approximately ten waste piles (totaling approximately 30,000 cubic yards) observed during the site reconnaissance from Griffin Wheel Company as a potential source of contamination for groundwater, surface water, soil exposure, and air pathways. Weston indicated the "site soil" was suspected to contain high levels of metals including arsenic, lead, chromium, cadmium, copper, and zinc. Waste material from the Crane Company was also observed throughout the site. The quantity and composition of the Crane Company waste was unknown. Weston indicated the Crane Company wastes were not evaluated since the contaminants from Griffin Wheel Company were perceived to be more hazardous to human health and the environment. The Weston report also indicated that the site stopped accepting wastes by 1985.

Memorandum, Guyaux Landfill (Located in City of Colton) – Background and Rationale for Not Taking Enforcement Action, RWQCB, February 22, 1995

In February 1995, the RWQCB issued a memorandum regarding potential enforcement action at the Guyaux landfill, which summarized activities related to the site from November 1994 to January 1995. Summary information included news articles published about the site, Mr. Guyaux receiving the title to the site in July 1994, and various meetings. The RWQCB determined that enforcement action would not be pursued at the site based on the following:

- According to the RIX study, the site "does not appear to be having a significant impact on groundwater." The PCE detected in the wells were consistent with other wells in the surrounding area, and some metals were "slightly" higher in the down-gradient RIX well versus the up-gradient well. Selenium had a "slight" exceedance of the Primary Drinking Water Standard, and the RWQCB concluded the elevated detection was potentially due to different sampling techniques since the down-gradient sample was not filtered.

- The site was well-graded and drains well.

- The site had not received wastes in over 12 years, and most of the wastes had been in place for more than 30 years. The RWQCB hypothesized that a significant volatile organic compound (VOC) plume or metals would have shown up during the 1989 RIX sampling.

- Further groundwater investigation would not add much to the RIX investigation, other than future changes in groundwater quality at the RIX wells. However, the down-gradient well was previously backfilled with grout and abandoned.

Site Inspection, Guyaux Landfill, End of South Florez and South Fernando Streets, Colton, CA 92324, Bechtel, May 15, 1995

In May 1995, Bechtel was tasked by the EPA to perform a Site Inspection (SI) following the results of the 1993 Weston PA. The purpose of the SI was to further investigate the Guyaux Landfill by using existing information and using the EPA's Hazard Ranking System (HRS). The HRS assesses the relative threat associated with actual or potential releases of hazardous substances at the site. Bechtel noted piles of used tires, piles of waste slag, furniture, and 10 empty 55-gallon drums during their site reconnaissance. According to Bechtel, a Phase II site assessment was performed at the Griffin Wheel Company in 1989 by Dames and Moore to characterize the waste slag. A copy of the Dames and Moore report was not provided to Ninyo & Moore for review. According to Bechtel, results of 1989 laboratory analyses of the waste slag

samples indicated elevated levels of Title 22 Metals, including 105 milligrams per kilogram (mg/kg) of arsenic, 72.1 mg/kg of cadmium, and 9,520 mg/kg of lead (concentrations three times greater than background levels). Based on the SI, Bechtel identified that the waste slag, the arsenic concentrations detected in the down-gradient groundwater well during the RIX study, and presence of three drinking water systems (operating 49 municipal drinking water wells) within 4 miles of the site as HRS factors.

Expanded Site Inspection, Guyaux Landfill, End of South Florez and South Fernando Streets, Colton, California 92324, Bechtel, August 14, 1996

In August 1996, Bechtel performed an ESI after the EPA reviewed the 1995 Bechtel SI. At the time of their January 1995 site reconnaissance, the site was not fenced and was covered with vegetation; however, during the ESI, the "landfill portion" of the site was graded and the vegetation cleared.

As part of the ESI, Bechtel collected 25 "soil" samples at the site and three groundwater samples from nearby irrigation wells owned and operated by the City of Riverside. "Soil" and groundwater samples were analyzed for Title 22 Metals and VOCs. Soil analytical results indicated concentrations of arsenic (up to 39.9 mg/kg), cadmium (up to 25.2 mg/kg), chromium (up to 383 mg/kg), lead (up to 5,600 mg/kg), manganese (up to 16,500 mg/kg), mercury (up to 1.1 mg/kg), and toluene (up to 150 micrograms per kilogram [µg/kg]) at concentrations greater than three times background levels. For the groundwater analytical results, Title 22 Metals and VOCs were not detected in the down-gradient well at concentrations three times above those detected in the cross-gradient or up-gradient wells. During the March 1996 "field event," Bechtel noted the WDS had been graded and relatively flat. Bechtel identified "dark foundry slag" on the site, and two partially buried drums on the south and east portions of the site. The contents of the drums were not identified.

As a result of the ESI, Bechtel identified the Griffin Wheel Company waste slag on the site as an "apparent problem." Based on the results of the ESI, the EPA issued a letter to Mr. Guyaux in 1997, determining the site did not qualify for listing on the federal National Priorities List (Superfund). The EPA identified the potential of exposing the public to site contaminants and

referred the site to the Department of Toxic Substances Control (DTSC) as the lead agency for further investigation and remediation.

The EDR Radius Map Report with GeoCheck, South Colton Project CEQA, Fogg Street/Congress Street, Santa Ana, CA 92324, EDR, March 3, 2009

An EDR radius map report, dated March 3, 2009, was prepared as part of the South Colton Project California Environmental Quality Act. The area of study for the radius report was a larger area in the Santa Ana River floodplain, which included the site. The site was listed as "Florez Street" on the United States Brownfields database. A Phase I Environmental Site Assessment was conducted at the site in 2001, and the current owners were listed as Isela Gonzales and David Avina. According to the database, the site was formerly the "Guyuak" Landfill (including solid wastes) from the 1960s through the mid-1980s. The landfill closed in 1985 prior to state closure regulations being in effect." The site was also listed as Guyaux Landfill on the Comprehensive Environmental Response, Compensation, and Liability Information System – No Further Remedial Action Planned database. This database is for archives sites that to the best of the EPA's knowledge, assessment at a site has been completed and that the EPA has determined no further steps will be taken to list this site on the National Priorities List. The link in the radius map report to this listing had expired and was not accessible. Additional information was not provided in the radius map report.

Workplan for Remediation of Lead-Impacted Soil, South Colton Site, Parcels 016336212, 016336226, and 016336227, Colton, California, Environmental Engineering and Contracting, Inc. (EEC), July 20, 2010.

In 2010, EEC prepared a work plan to remediate lead-impacted soil at the site. According to EEC, the property owner (The Maturin Group) planned to raise the grade of the site out of the 100-year floodplain using engineered fill. EEC indicated that a Phase II ESA report, prepared by EastStar Environmental Group (EastStar) in 2009, estimated approximately 98,000 cubic yards of waste material and soil were placed on the site. A copy of the 2009 EastStar report was not provided to Ninyo & Moore for review.

EEC planned to excavate three locations to remove lead that exceeded the action level of 1,000 mg/kg identified in the 1996 Bechtel ESI. A letter from the RWQCB, dated July 23, 2010, approved the EEC work plan and requested a report detailing the removal activities upon completion of the cleanup project. The proposed scope of work in EEC's Workplan was not implemented.

Letter, Final Environmental Impact Report (EIR) for Soil Safe Land Improvement Project, City of Colton, San Bernardino County, RWQCB, March 23, 2011.

In 2011, the RWQCB approved a Final Environmental Impact Report (FEIR) for the Soil Safe Land Improvement Project, which proposed to grade and fill a 29-acre property with non-hazardous treated soils in order to raise the site's elevation above the Santa Ana River floodplain. The FEIR was not available to Ninyo & Moore for review. Although the precise location of the 29-acre property was not identified in the RWQCB letter, it is assumed that the property identified in the FEIR is the Guyaux Landfill.

Memorandum, Guyaux Landfill Update, City of Colton, Development Services Department, September 6, 2012.

In September 2012, the City of Colton Development Services Department (the City) issued a memorandum to the mayor and council members summarizing research the City performed on the Guyaux Landfill. According to the City, Mr. Mike Griffin was identified as a former property owner willing to cooperate on clean-up activities, however the site was in receivership and the bank and other creditors were not currently willing to clean up or sell the property. After discussing the site with environmental engineers and the RWQCB, the City determined there was minimal health risk to nearby residents from exposure to the former landfill, but there was a possibility of long-term impacts on groundwater from continued leaching of rain/runoff through the landfill. A soil study conducted at the site (Bechtel, 1996) found lead exceeding federal standards at several "hot spots." Soil Safe tested soil and installed five groundwater monitoring wells at the site in 2010. According to the City, the 2010 investigation "did not find lead levels that meet hazardous thresholds" in soil, and trace VOCs were detected in groundwater, "but not at hazardous levels, and no discernable impacts on groundwater." The RWQCB recommended

the City review historical information on the site, investigate the "hot spots", design and install drainage improvements to move runoff around the landfill, and cover the landfill with topsoil or other cover.

9. PROPOSED PHASE II ESA

The proposed Phase II ESA activities is based on the project objectives indicated in this work plan which are to characterize and delineate the lateral and vertical extent of wastes, pre-characterize wastes in the event some may be disposed of offsite and evaluate the potential presence of cover, thickness and characteristics. This section describes the proposed scope of work to be performed as part of the Phase II ESA activities at the site.

9.1. Work Plan Approval, Permits, and Notifications

A copy of this work plan will be submitted to the County of San Bernardino, Division of Environmental Health Services, acting as the LEA and due to recent events affecting staffing issues, CalRecycle for their reviews and approvals prior to starting the fieldwork. Permits are not required for the planned test pit/trench excavations. It is assumed that the City will arrange access to the site. City staff will be notified a minimum of one to two weeks in advance of the planned site Phase II ESA and the dates the work will be performed.

The applicable regulatory agency personnel will be notified of the proposed Phase II ESA schedule approximately one to two weeks prior to conducting the fieldwork.

- Underground Service Alert (USA), a public utility locator, will be notified of the proposed site investigation area test pit/trench locations a minimum of 48 hours before field activities start so that they can contact representatives of utility companies in the area.

9.2. Site-Specific Health and Safety Plan (SHSP)

A SHSP will be prepared that identifies the potential chemical and physical hazards that may be encountered during the field activities. The SHSP will be prepared in compliance with Occupational Safety and Health Administration (OSHA) requirements, and will be implemented during the subsurface site investigation. The plan will address field procedures, personal

protection equipment, anticipated contaminants, and establish action levels for exposure to contaminants and contingency plans for emergencies that may arise during the fieldwork.

Prior to commencing field activities, site workers will be required to read and sign the SHSP, acknowledging their familiarity with its provisions and commitment to adhering to its requirements. In addition, the SHSP will provide guidelines for use of personal protective equipment based on site-specific conditions, constituents of potential concern (COPC), and the location of and directions to the nearest hospital. The SHSP will include information regarding health and safety monitoring guidelines that will be conducted during site activities to protect on-site staff. Prior to beginning fieldwork at the site, the SSO will conduct a tailgate meeting and discuss the key features of the plan. A tailgate safety meeting will be conducted each day prior to the commencement of fieldwork.

Air monitoring will be conducted to identify and quantify airborne contaminants to prevent community exposure to hazardous levels of such contaminants. Air monitoring will be conducted for total dust, VOCs, and landfill gases during the site assessment activates. Air monitoring for total dust and direct readings of methane, VOCs, and H_2S will take place at the active work areas. Due to the close proximity of residences to the north, perimeter dust monitoring for these constituents will also be conducted.

9.3. Community Health and Safety Plan

Ninyo & Moore will prepare a CHSP intended to protect the public and surrounding properties from potential health and environmental hazards during the planned Phase II ESA activities. The CHSP will address field procedures, anticipated contaminants, established action levels for exposure to contaminants, and contingency plans for emergencies that may arise during the fieldwork. The CHSP will be prepared in accordance with applicable OSHA requirements, and will be implemented during the site assessment. The CHSP will be signed by a certified industrial hygienist.

Perimeter air monitoring will be conducted to the north and west of the WDS to identify and quantify airborne contaminants to prevent community exposure to hazardous levels of such

contaminants. Air monitoring will be conducted for total dust, VOCs, and landfill gases during the site assessment activates. Air monitoring for total dust and direct readings of methane, VOCs, and hydrogen sulfide (H_2S) will take place at the active work areas. Due to the proximity of residences to the north and west, perimeter dust monitoring for these constituents will also be conducted.

9.4. Test Pit/Trench Utility Clearance

USA, a public utility locator that contacts utility companies that may have potential underground utilities or structures in the area, will be notified, as required by law, a minimum of three days prior to the investigation. Both prior to, and concurrent with fieldwork, the proposed test pit/trench locations will be staked in the field with wooden stakes and survey flagging. These excavation areas will be further evaluated concurrent with the geophysical survey. Test pit/trench sampling locations and rationale for their selection are discussed later in this work plan.

9.5. Geophysical Survey

A private geophysical consultant will conduct a geophysical survey of the site to evaluate subsurface anomalies that may be present at the landfill. The survey will be conducted concurrent with the site investigation. A combination of electromagnetic induction, magnetometry, ground-penetrating radar and a utility locator with line tracing capabilities will be used during the survey. Although not suspected, if subsurface utility conflicts are identified, the proposed test pit/trench location will be adjusted. A geophysical report will be prepared, which will include maps showing the locations of any anomalous features. A copy of the geophysical report will be provided in the site investigation report.

9.6. Proposed Test Pit/Trench Locations and Rationale

Approximately 20 test pits/trenches are proposed as generally indicated on Figure 4. The number of proposed excavations will be sufficient to characterize the waste and provide an estimate of the in-place waste volume related to the site being developed as a regional soccer

complex and community park. The investigation will be conducted by or under the direct supervision of a California-registered professional geologist. The field staff will observe sampling locations from exploratory test pit/trench excavations, stockpiles and sidewalls, collect samples, and document observations and sample locations with photographs and on individual test pit/trench logs. The individual test pit/trench logs will indicate the approximate depths/locations, types, and estimated percentages of wastes based on field observations and graphically present this information.

In general, the test pits/trenches will be located and oriented to obtain information about the extent of the wastes. The number and locations of test pits will be modified as the investigation progresses to take into account observations and conditions encountered in the field. Additional areas will likely be excavated and sampled using authoritative protocol and based on the results of the concurrent geophysical survey to be conducted for the site. Table 1 summarizes the locations and rationale for each proposed test pit/trench and Figure 4 indicates their proposed approximate locations. As previously mentioned, locations will be adjusted in the field, as necessary to accomplish the project objectives.

Table 1 – Proposed Exploratory Test Pit Locations and Rationale

Test Pit/Trench ID	Proposed Depth	Location	Rationale
T-1	~1 to 2 feet below bottom of waste, as possible	Northern site boundary west of South Fernando Street and adjacent east of recently constructed residential property	Evaluate northern extent of wastes adjacent to a residential property, will provide information on whether wastes likely extend off site
T-2	~1 to 2 feet below bottom of waste, as possible	Northern site boundary, west of South Fernando Street and south of residential property	Evaluate northern extent of wastes adjacent to a residential property on west side of South Fernando Street, will provide information on whether wastes likely extend off site
T-3	~1 to 2 feet below bottom of waste, as possible	Northeastern site boundary, south of the terminus of South Fernando Street	Evaluate northeastern extent of wastes at the northeastern site boundary with adjacent South Fernando Street, will provide information on whether wastes likely extend off site
T-4	~1 to 2 feet below bottom of waste, as possible	~90 feet southwest of South Fernando Street	Evaluate vertical extent of waste

Table 1 – Proposed Exploratory Test Pit Locations and Rationale

Test Pit/Trench ID	Proposed Depth	Location	Rationale
T-5	~1 to 2 feet below bottom of waste, as possible	Northern site boundary, adjacent and immediately east of South Florez Street, and south of vacant lot	Evaluate lateral extent of wastes adjacent to an offsite vacant land parcel that may in the future be developed with a residence, will provide information on whether wastes likely extend off site
T-6	~1 to 2 feet below bottom of waste, as possible	Northern site boundary, immediately south of vacant lot, east of South Florez Street	Evaluate lateral extent of wastes adjacent to an offsite vacant land parcel that may in the future be developed with a residence, will provide information on whether wastes likely extend off site
T-7	~1 to 2 feet below bottom of waste, as possible	Central waste disposal site area based on 1968 aerial photograph	Evaluate lateral and vertical extent of waste
T-8	~1 to 2 feet below bottom of waste, as possible	~50 feet west of the suspected easternmost limits of waste disposal	Evaluate the previously identified "hot spot" sample SS- 9/26 (Bechtel, 1996) of lead impacted "soil" and vertical extent of waste
T-9	~1 to 2 feet below bottom of waste, as possible	Suspected eastern extent of waste disposal	Evaluate lateral and vertical extent of suspected easternmost extent of waste
T-10	~1 to 2 feet below bottom of waste, as possible	Northern site boundary, adjacent and immediately south of residential property, west of South Florez Street	Evaluate northern extent of wastes adjacent to residential property, will provide information on whether wastes likely extend off site
T-11	~1 to 2 feet below bottom of waste, as possible	Immediately south of South Florez Street	Evaluate northern extent of wastes at the terminus of South Florez Street, will provide information on whether wastes likely extend off site to the north
T-12	~1 to 2 feet below bottom of waste, as possible	Central portion of waste disposal site	Evaluate the previously identified "hot spot" sample SS-16 (Bechtel, 1996) of lead impacted "soil" and vertical extent of waste
T-13	~1 to 2 feet below bottom of waste, as possible	Western site boundary, adjacent to off site undeveloped lot/industrial property	Evaluate the westernmost extent of wastes towards the offsite industrial property, will provide information on whether wastes likely extend off site to the west.
T-14	~1 to 2 feet below bottom of waste, as possible	Southwestern waste disposal site area, ~100 feet south of T-11	Evaluate lateral and vertical extent of wastes and the dark colored wastes/soils observed during site reconnaissance
T-15	~1 to 2 feet below bottom of waste, as possible	South central waste disposal site area, adjacent to previous Bechtel (1996) samples SS-21 and SS-28	Evaluate lateral and vertical extent of wastes and the presumed black slag material observed on top of landfill facing northwest (Bechtel 1996)
T-16	~1 to 2 feet below bottom of waste, as possible	Suspected southwest extent of waste disposal, near SS-10 and north of dirt road	Evaluate lateral and vertical extent of wastes and the dark colored wastes /soils observed during site reconnaissance

Table 1 – Proposed Exploratory Test Pit Locations and Rationale

Test Pit/Trench ID	Proposed Depth	Location	Rationale
T-17	~1 to 2 feet below bottom of waste, as possible	South central waste disposal site area	Evaluate the previously identified "hot spot" sample SS-19 (Bechtel, 1996) of lead impacted "soil" and vertical extent of waste
T-18	~1 to 2 feet below bottom of waste, as possible	Suspected southeastern extent of waste disposal, north of dirt road	Evaluate lateral and vertical extent of wastes
T-19	~1 to 2 feet below bottom of waste, as possible	Suspected south-southwestern extent of waste disposal, north of dirt road	Evaluate lateral and vertical extent of wastes
T-20	~1 to 2 feet below bottom of waste, as possible	Suspected southeastern extent of waste disposal, north of dirt road	Evaluate lateral and vertical extent of wastes
T-21	~1 to 2 feet below bottom of waste, as possible	Suspected west-southwestern extent of wastes	Evaluate west-southwestern extent of wastes towards the offsite undeveloped lot/industrial property, will provide information on whether wastes likely extend off site to the west
T-22	~1 to 2 feet below bottom of waste, as possible	South central waste disposal area, between previous Bechtel (1996) samples SS-22 and SS-27	Evaluate south central waste area, lateral and vertical extent of wastes

9.7. Trench Excavation - Methodology

An experienced OSHA 40-hour HAZWOPER certified operator will use an excavator or backhoe to excavate subsurface materials at each proposed test pit/trench location. Similarly trained assistants will help with directing excavation and controlling dust by applying water, as necessary. If wastes are observed in a test pit/trench, the excavation will continue until the contact between the base of the waste and the underlying alluvium is encountered and then extends a foot or two deeper to confirm the waste depth and collect a sample of the underlying alluvium. If wastes are not observed, or at locations with minimal wastes (e.g., only surficial wastes), excavation will continue to depths adequate to confirm the absence of wastes and the presence of alluvium. In general, each test pit/trench will be excavated to a depth adequate to confirm the absence of wastes, and/or adequate to evaluate the depth of wastes, if present, and/or to the maximum depth that can be safely excavated with the equipment, and/or to a depth adequate to confirm the absence of wastes, as applicable. Groundwater, if present, may affect the depth of waste excavation. Actual test pit/trench length, width, and depth will depend on site conditions, including depth and characteristics

of the wastes. Test pits and trenches will only remain open long enough to log, collect samples, and document the excavation and subsurface conditions on individual test pit/trench logs and with photographs. Because only one trench will be excavated at a time, backfilling will be conducted shortly after excavation.

During excavation, test pit/trench spoils will be managed to minimize potential runoff. If excessive potential contamination (e.g., liquids or buried damaged metal drums, etc.) is observed, Visqueen™ plastic sheeting may be placed on the ground surface adjacent to the excavation prior to or during stockpiling the spoils. The excavated materials will be placed a minimum of two feet from the test pit/trench excavation and in such a manner that the materials will be prevented from falling back into the open trench. During excavation, clean cover soils, if present, will be placed on one side of the excavation. Wastes, if encountered will be placed on the opposite side of the test pit/trench to prevent commingling with other excavated material. Dust control/suppression during excavation and backfilling will be provided, as necessary, by the excavation subcontractor.

Following logging and sampling, each excavation will be restored, to the extent practical, to its original condition, by backfilling with its own excavated materials. Each trench will be backfilled in the approximate reverse order in which it was excavated. The equipment operator will compact the excavated area using the excavation equipment in a typical manner using the bucket and/or driving over the excavation with the backhoe. Disturbance of adjacent areas, such as ruts created by excavating and related equipment and vehicles, will be smoothed out, as practicable, to match the surrounding ground surface.

If wastes contain large items or debris that cannot be placed back into the excavation during backfilling, they will be left in place and excavation will continue at adjacent areas. After backfilling, each test pit/trench will be re-staked for future reference. The orientation of each excavation will be recorded using a Brunton compass or equivalent instrument, and the GPS coordinates of the staked location and sample point will be recorded on the individual test pit/trench logs.

9.8. Test Pit/Trench Sampling

Samples from exploratory test pits/trenches for analytical testing will include cover fill soils, waste samples, if present, and/or fill soils surrounding wastes, and a sample of the underlying alluvium, as possible. The specific sample locations and depths will be based on field observations, subsurface conditions, project objectives, and this work plan. Typically, between two and four discrete samples will be collected at each test pit/trench excavation; the actual number will depend on the depth of the excavation and subsurface materials encountered. Typically, one to two samples will be collected from the wastes, and if the wastes are relatively thick and/or highly variable, additional samples may be collected. A sample will also be collected in the underlying alluvium (native soil), directly beneath the wastes.

Waste samples will be collected, as much as possible, unless the material is not conducive to sampling (e.g., solid wastes) in which case, samples of interlayered soils, if present between layers of waste will be collected. If waste is not observed in the test pit/trench excavation, a surface sample and an additional sample at depth will be collected for possible analytical testing.

Background samples will be collected, as necessary to establish background metal concentrations. Three background soil samples will be collected outlying the waste disposal area and analyzed for Title 22 metals (east, west and south of the waste disposal limits).

Only discrete samples will be collected from the exploratory test pit/trench excavations, and as background samples (i.e., samples will not be composited). Field staff will use authoritative sampling protocol to determine sample locations. Sample depths and locations will be selected based on the field observations and instrument screening of subsurface materials encountered and sample locations will be measured and recorded on individual test pit/trench logs. Test pit/trench spoils and samples will be screened for VOCs using a photoionization detector (PID) and for gases using a four-gas meter.

Following sampling, each location will be backfilled by placing the excavated materials back into the test pit/trench in the approximately reverse order that it was removed. Test pit/trench

excavations will remain open long enough to obtain and record necessary data. Compaction and testing of the backfilled materials will not be performed.

9.9. Air Monitoring

Field screening of each test pit/trench excavation will be conducted using a four-gas meter that monitors lower explosion limit, oxygen, H2S, and carbon monoxide and a photoionization detector that provides VOC readings for health and safety. The readings will be recorded to document field conditions and for potential future reference. Airborne contaminants and dust may be temporarily generated during the excavation and backfilling of solid wastes. The primary concerns are exposure to contaminants in the form of fugitive dust, reduced visibility and nuisance caused by dust. Air monitoring will be conducted during all periods of active field operations to assess for possible offsite migration of dust and to ensure the health and safety of site workers. Several elements of South Coast Air Quality Management District Rule 403, such as protocols for mitigation of potential fugitive dust emissions will be followed. The potential contaminants in dust may include Title 22 Metals, total petroleum hydrocarbons (TPH), VOCs, and SVOCs. Additional information pertaining to air monitoring will be provided in the SHSP. The SHSP will provide procedures for monitoring potential concentrations of VOCs and landfill gases in areas of active excavation. Although landfill gas is not anticipated based on the nature of the wastes, the SHSP provides action levels and engineering controls to prevent potentially dangerous situations related to landfill gas accumulation. On-site air monitoring will be performed in the breathing zone of the workers closest to the active excavation area. The purpose of breathing zone monitoring is to minimize exposures to COPCs. Personal air monitoring will be conducted to document those workers in the immediate vicinity of the excavation activities are not exposed to concentrations of COPC exceeding the action levels as indicated in the SHSP. Daily air monitoring will also be performed at the site locations along the site's perimeter. Personal air monitoring will also be conducted to protect the community located in the residential homes located immediately to the west and north of the WDS in accordance with the CHSP. All air monitoring activities will be documented on field forms.

10. DOCUMENTATION

The following sections describe documentation procedures to be conducted during the site investigation.

10.1. Sample Handling

Each sample jar will be immediately labeled to ensure proper identification for tracking by the analytical testing laboratory. Each container will be labeled with test pit/trench identification number, sample depth, date, and time the sample was collected, and project location and number. The Chain of Custody (COC) forms will be completed for each sample at the time of collection and will be maintained through sample delivery to the analytical testing laboratory. Sample jars from each excavation will be placed into zip-lock plastic bags and labeled with the sample identification location.

Samples will be placed into coolers containing ice and picked up by a certified Laboratory as soon as practicable, usually within 24 hours of collection. COC documentation will record the description, possession, condition, and transfer of samples.

10.2. Test Pit/Test Pit/Trench Logs

Field personnel will record the following information on individual test pit/trench logs:

- Project name and number.
- Unique test pit/trench identifier (such as "T-1") and datum.
- Type of excavation equipment.
- Date test pit/trench is excavated/backfilled.
- Name of persons logging and sampling the excavations.
- Test pit/trench log including a scaled sketch of the excavation, total depth excavated; depths of cover fill soils, wastes, and/or alluvium; sample locations, and although not anticipated, groundwater/perched groundwater.
- Descriptions/visual classification of subsurface materials encountered, including:

- Unified Soil Classification System classification of fill/cover soils, based on field observations.
- General descriptions of wastes, if encountered, including an estimate of the percentage of wastes relative to fill soils that may be present and primary constituents comprising the waste (e.g., wood, concrete, brick, rubber, metal debris, etc.).
- Lithologic descriptions of native materials/geologic formation (alluvium).

- PID and four-gas meter readings.

10.3. Daily Report of Field Observations

In addition to the test pit/trench and stockpile sampling logs, the following information will be recorded on a Daily Report of Field Observations to be completed each day by field personnel.

- Project staff and their responsibilities.
- Visitors to the site, their arrival and departure times, and information pertaining to their visit.
- Deviation(s) from the work plan and rationale.
- Level(s) of health and safety protection.

10.4. Photographs

At each test pit/trench sampling location, photographs will be taken to document excavating and backfilling activities, and will include the test pit/trench excavation, spoils, and the excavation area after it was backfilled and re-staked. The photographs will document and supplement information recorded on the individual test pit/trench logs and the Daily Report of Field Observations. Each photograph will include information identifying the subject, location, date, and time.

11. ANALYTICAL TESTING PROGRAM

COPCs associated with waste disposal sites typically consist of construction debris, rubber, glass, concrete, brick and metal. The analytical testing program will also include testing to

generally pre-characterize the wastes for potential off-site waste disposal. The COPCs and their associated analytical methods are listed below:

- Total metal concentrations (Title 22 metals) by EPA test methods 6010B/7471A.
- Depending on total metal concentration analytical results and previous analytical data, some samples will be additionally analyzed for STLC and/or TCLP concentrations.
- TPH extended range (TPH-diesel and TPH-motor oil [C_{13}-C_{40}]) by EPA test method 8015M.
- Organochlorine pesticides (OCPs) by EPA test method 8081A.
- Polychlorinated biphenyls (PCBs) by EPA test method 8082.
- VOCs by EPA test method 8260B. A few select samples will be analyzed for VOCs and if air monitoring (using a PID) indicates their potential presence.
- SVOCs by EPA test method 8270C.
- Three background soil samples will be collected west, south, and east of the landfill perimeter and analyzed for Title 22 metals by EPA Methods 6010B/7471A to compare the background metal results with site specific metal concentrations.

The following table summarizes the proposed analytical testing program based on an assumed 20 exploratory test pits/trenches. The actual number of samples analyzed and analytical testing will depend on actual field observations, including whether the eastern parcel was used for waste disposal.

Table 2 – Proposed Analytical Testing Program

Constituents of Potential Concern	EPA Test Method	Approximate Number of Samples to be Analyzed
Title 22 metals (TTLC)	6010B/7471A	50
Title 22 metals (STLC), as required	TBD	TBD
Title 22 metals (TCLP), as required	TBD	TBD
Semi-Volatile Organic Compounds	8270C	22
Volatile Organic Compounds	8260B	22
Polychlorinated biphenyl (PCBs)/Organochlorine pesticides (OCPs)	8082A/8081	5 (samples with highest metals concentrations)
Total Petroleum Hydrocarbons (extended range) (TPH-diesel and TPH-motor oil [C_{13}-C_{40}])	8015B (M)	22

Notes:
The proposed number of samples to be analyzed by each test method is an estimate only; the actual number of samples to be analyzed will be based field observations during the Phase II ESA
TTLC Total Threshold Limit Concentration
STLC Soluble Threshold Limit Concentration
TCLP Toxicity Characteristic Leaching Procedure
TBD To be determined.
The number of samples and actual metals to be analyzed for STLC and/or TCLP will be based on the TTLC concentration of a particular metal. Samples will be further analyzed if the metal concentration is equal to or exceeds 10 times the established STLC and is less than the established TTLC for that metal and/or if the TTLC concentration is equal to or 20 times the TCLP for that specific metal.

12. QUALITY ASSURANCE/QUALITY CONTROL

Field duplicates generally involve collecting two separate samples of the same matrix at the same time and same location, and using the same sampling procedures to document that sampling techniques are consistent and are not influencing the analytical results. However, wastes are inherently heterogeneous, therefore, even if two samples are collected in the same exact manner and side by side, the analytical results will be different and may not be comparable because the wastes or materials that compose the fill are inherently different. Field duplicates of wastes, are therefore, not a reliable indicator of accuracy, representativeness, or precision and will not be collected.

A trip blank consists of a sample of deionized water provided by the laboratory that is kept with samples to be analyzed for VOCs, after sample collection and during transport to the laboratory. Waste samples collected as part of this investigation are solid, not liquid samples, and will be collected into containers that are not used for liquid samples; therefore, trip blanks are not applicable to this investigation. The proposed sample collection methodology does not require using sampling equipment; therefore, equipment blanks are not required. Numerous solid waste disposal site investigations conducted throughout California have not included field duplicates, trip or equipment blanks.

Data validation associated with the analytical testing will include the following:

- Sample holding time
- Sample methods
- Analytical method
- Sample preservation
- Chain-of-custody records
- Detection limits
- Possible transcription errors
- Surrogate recoveries
- Matrix spike recoveries and matrix spike duplicate recoveries
- Calibration checks

13. MANAGEMENT OF INVESTIGATION-DERIVED WASTE

After completion of field activities, equipment, unused materials, and other miscellaneous items resulting from, or used in, the investigation will be removed from the site. Each test pit/trench sampling location will be backfilled with materials excavated from each trench location; therefore, investigation-derived waste (IDW) will not be generated during the planned field investigation. As previously mentioned, although not likely, if oversized waste materials are encountered while excavating, they will likely not be excavated (unless specifically requested by the regulator), and excavation will continue adjacent to these items. If the oversized debris needs to be excavated, it will either be placed back into the excavation during backfilling or may be disposed of off-site, if requested by regulatory personnel.

Used personal protective equipment (e.g., sampling gloves, respirator cartridge, if required, etc.) will be bagged and disposed of in a municipal refuse dumpster.

14. REPORTING

Following completion of fieldwork and the analytical testing, the data will be summarized and presented in a site investigation report. The report will include descriptions of field methodologies, tabulated analytical data, analytical reports accompanied by COC documentation and quality assurance/quality control documentation, figures and tables, a summary of findings and conclusions, and recommendations.

The report will include a GIS-based site map identifying each exploratory test pit/trench location and orientation and indicate the sample locations and waste depths. Cross sections will be prepared depicting subsurface conditions. An in-situ volume of waste will be provided, accompanied by the assumptions used to arrive at the estimate. The report will also include test pit/trench logs and photographs. The report will be prepared in accordance with applicable regulatory guidelines.

-STATE OF CALIFORNIA
GEORGE DEUKMEJIAN, Governor

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SANTA ANA REGION

6809 INDIANA AVENUE, SUITE 200
RIVERSIDE, CALIFORNIA 92506

PHONE: (714) 684-9330

April 10, 1985

Mr. Ralph Guyaux
P. O. Box 143
Colton, CA 92324

Dear Mr. Guyaux:

REQUEST FOR SUBMITTAL OF PROPOSED MONITORING PROGRAMS FOR EXISTING WASTE MANAGEMENT UNITS

Revised regulations governing the discharge of waste to land contained in Subchapter 15 of Title 23, Chapter 3 of the California Administrative Code, became effective on November 27, 1984. These regulations established a deadline for submittal of monitoring programs by dischargers who own or operate existing landfills, surface impoundments or waste piles (i.e. waste management units).

All existing waste management units must have ground water monitoring systems which comply with the requirements of Article 5 of Subchapter 15. Dischargers who own or operate existing units are required by Section 2510(d) to submit their proposals for achieving compliance to the Regional Board within six (6) months of the effective date of the revised regulations. Our records indicate that your agency owns or operates the active waste management units identified on the attached list. Technical reports describing the measures you intend to take to bring your monitoring into compliance with Article 5 must be submitted to this office no later than May 28, 1985. This report shall also include a detailed time schedule for achieving compliance with the monitoring requirments.

Technical reports describing proposed monitoring of closed or inactive waste management units listed will be required at a later date.

A workshop on the Subchapter 15 regulations is in the process of being scheduled and will be held in Orange County. We will inform you of the exact time and place when that information is available. However, since the workshop may not be held until early May, it is strongly recommended that you not wait for this workshop, but instead, begin work on your proposed monitoring program as soon as possible.

After your proposed monitoring program has been submitted and reviewed and approved by the Regional Board, the self-monitoring program included in your current waste discharge requirements will be revised to incorporate the new monitoring program. Monitoring information resulting from this new program will be reviewed and used by the Regional Board in revising your waste discharge requirements in accordance with the regulations contained in Subchapter 15.

Enclosed for your information are several excerpts from the revised Subchapter 15 regulations. These are being provided to give you a general idea of the new requirements. The complete text of the Subchapter 15 regulations should be on hand at the County Law Libraries. Copies of Title 23, which contains Subchapter 15, are available at a cost of fifteen (15) dollars from the Office of Procurement, Publications Section, P. O. Box 1015, North Highlands, CA 95660.

If you have any questions regarding submittal of your proposed monitoring programs, please contact Mark G. Adelson.

Sincerely,

JAMES W. ANDERSON
Executive Officer

Site List

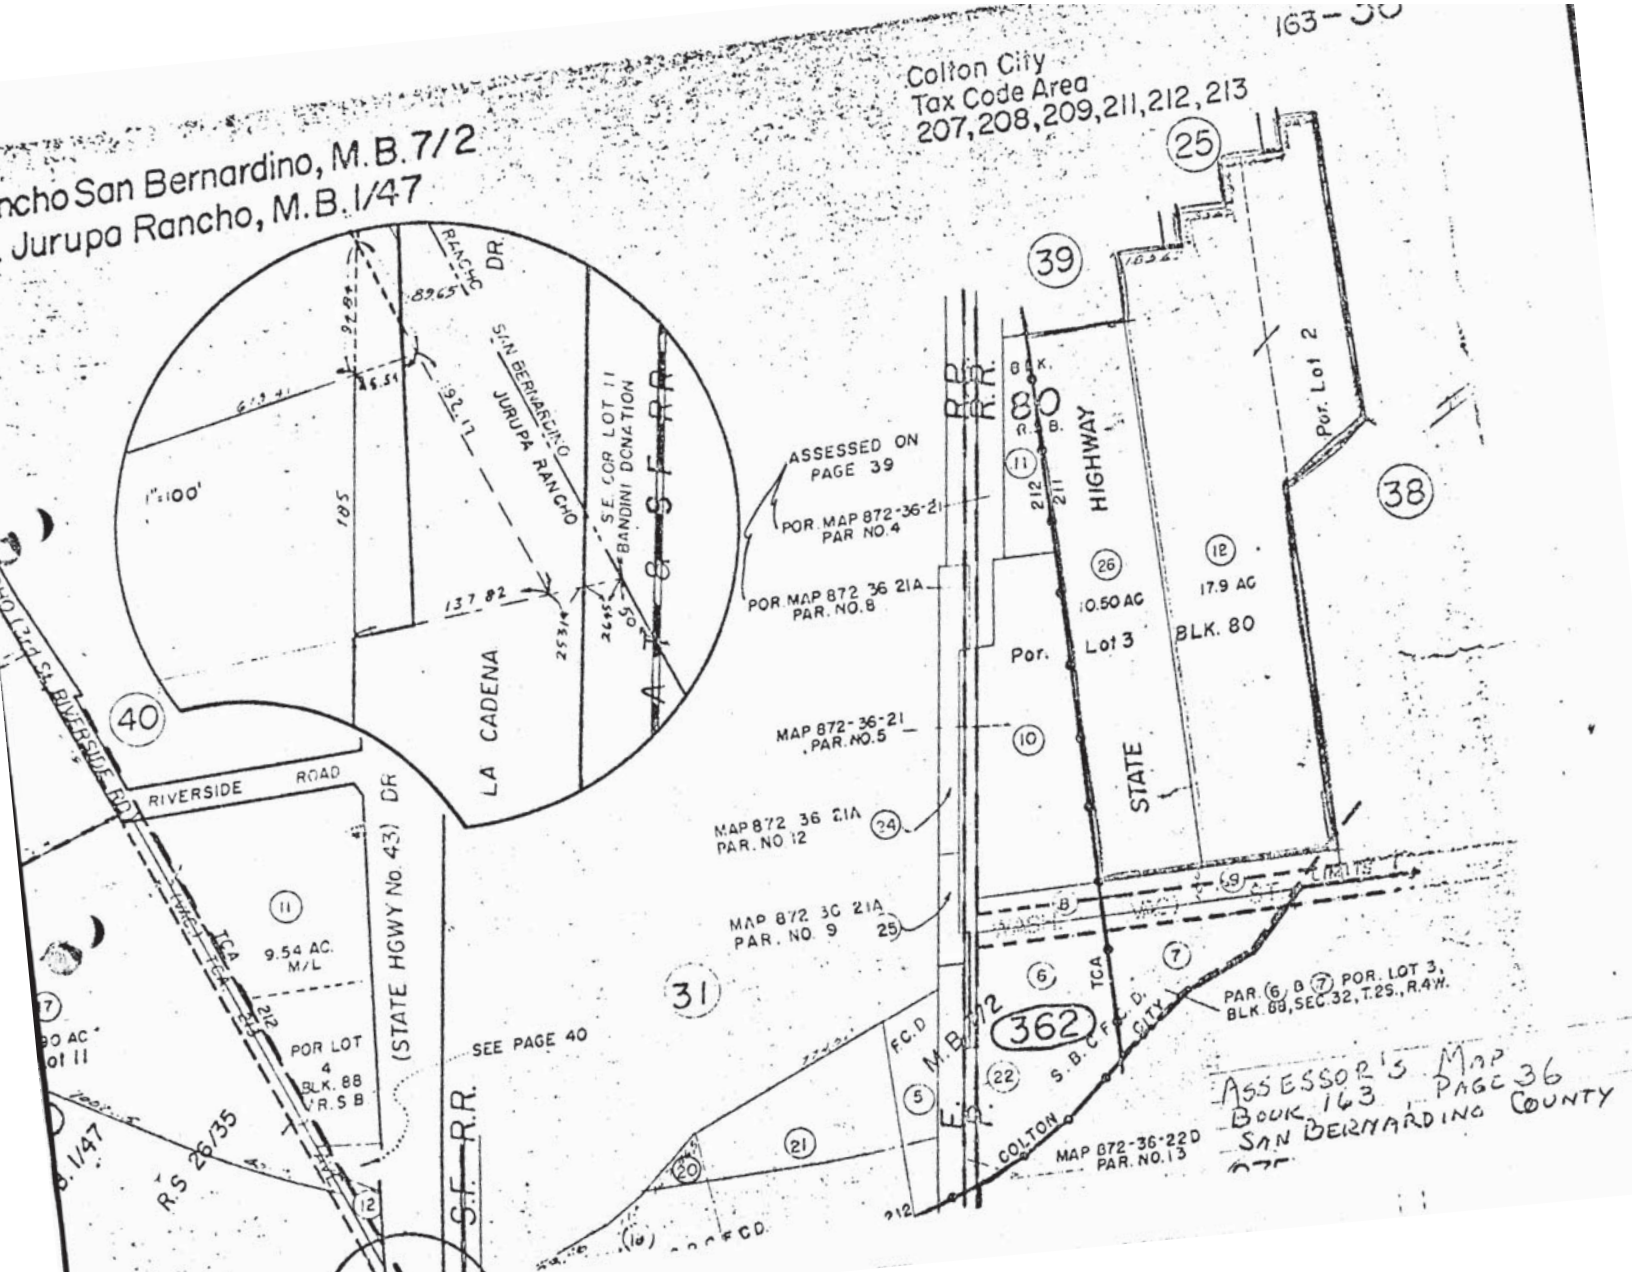
MGA:kyb

SITE:

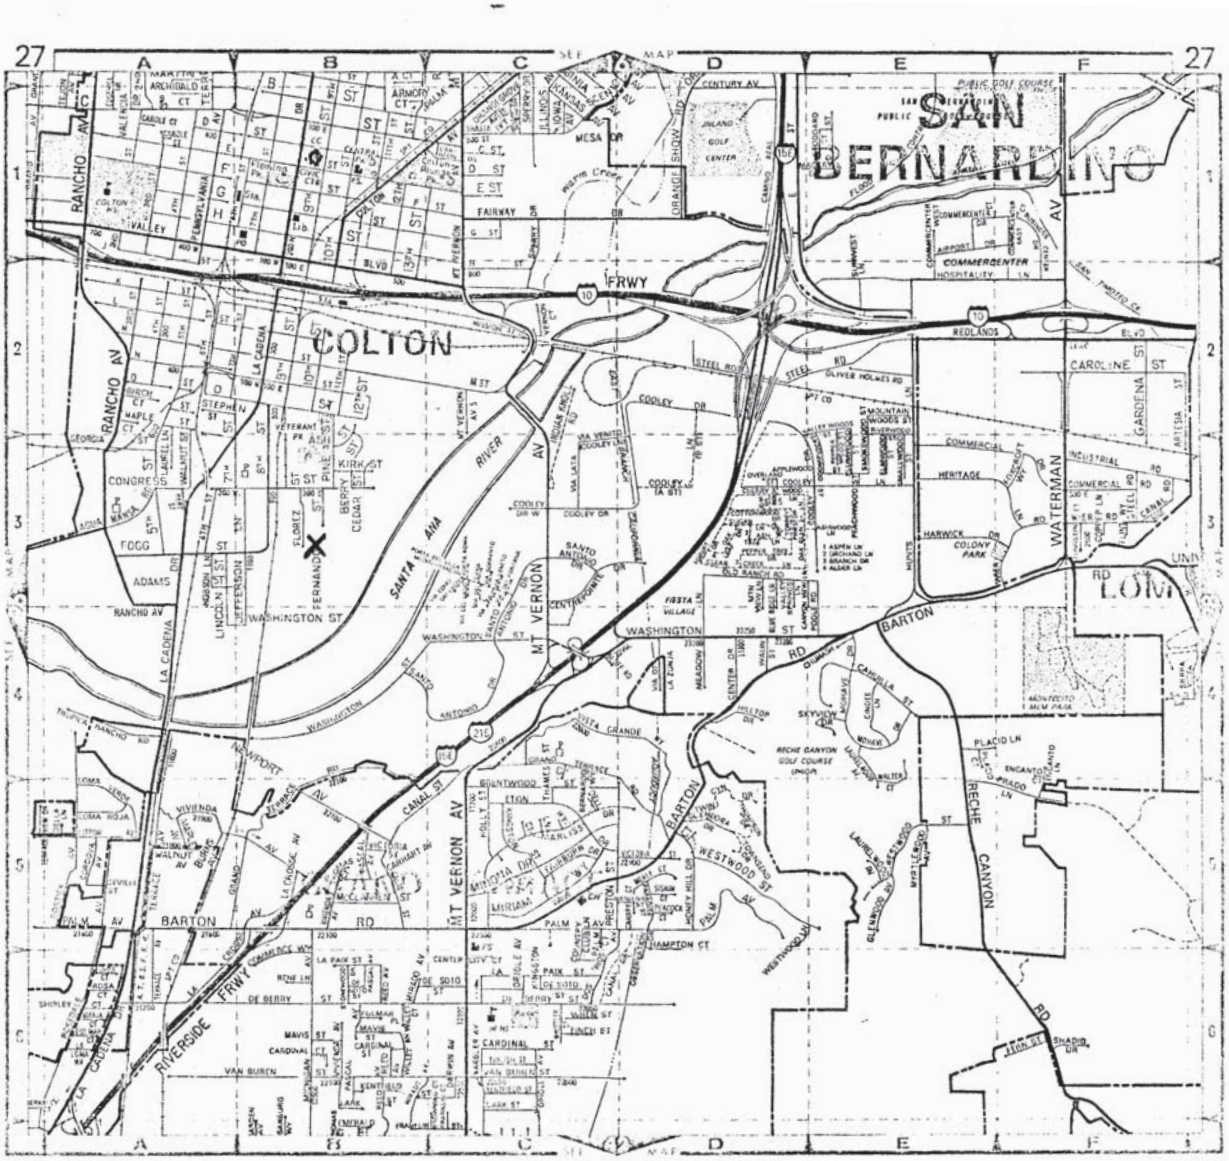
- South Colton

Guyaux

Field check of sites 9/12/84.



Kaiser Steel - old landfill covered with lots of slag. Will eventually be removed. Operation at top of pile now - only removing metallics. Combustables dumped, but slag set them on fire, so dump closed.



Crestmore Site

½ of site park - being irrigated. Rest of site flat except for west end - ditch with wood dumped over side. Site fenced.

Ralph Guyaux - lots of garbage dumped + left uncovered. Rusty equipment on top of site. Several barrels at bottom of slope at site. Large pile of scrap metal at top of site. Scrap wood piles on top of site. Piles of concrete + asphalt at edge of site. No fence around site. Easy access.

Cooley Ranch - concrete dumped down hill on creek side of road. Some wood exposed. Good slopes on front + back of site, top - uneven grading, not too bad.

Dear Mr. Zasadzinski:

I want to thank you for the copy of the letter that you sent this department regarding Mr. Ralph Guyaux. The City of Colton has had several complaints and problems regarding Mr. Guyaux's illegal operation.

I would be very interested in any further dealings which you or the Board might have with Mr. Guyaux. Please include this office in any further correspondence with the applicant.

Again, thank you for your time and cooperation. If I may be of any assistance in the future, please let me know.

Sincerely,

Jaime R. Aguilera
Planning Director

Dear Mr. Gonzales:

I am in receipt of your letter dated August 20, 1979, regarding C. U. P., File Index No. C-8-77.

On November 9, 1978 Mr. Earl L. Young, Director of Community Services directed a letter to Mr. Cliford Davenport, a copy of which was submitted to me, regarding removal of the fence structure (gate) at the end of the paved section on Florez Street. Under protest the gate was removed.

Please be advised it is impossible for me to police the property or prevent trespassing. You were so advised at the time you ordered the gate removed that it would be impossible to control access to the property.

Sincerely,

Ralph Guyaux

Enclosure

Certified copy of a portion of the minutes of a Regular Meeting of the City Council of the City of Colton held May 16, 1978, showing the opening and closing of the meeting and the action pertaining to Conditional Use Permit, P.C. Res. No. 847.

* *

REGULAR MEETING MAY 16, 1978

A regular meeting of the City Council of the City of Colton was held on the above given date at 7:30 p.m., in the Council Chambers of City Hall, Mayor Gonzales presiding.

ROLL CALL:

Council Members present were Hayes, Cisneros, Rehrer, and Mayor Gonzales. Also present were City Manager Calabrese, City Attorney Edwards, and City Clerk Ramos.

PLANNING COMMISSION REPORTS AND RECOMMENDATIONS:

Conditional Use Permit
P.C. Res. No. 847

Mr. Gonzales reported on a Conditional Use Permit application, that had been reviewed and tabled at a previous Council Meeting held October 18, 1977, with regard to continuance of an established landfill operation on a site consisting of approximately 28 acres located southerly of Flores and Fernando Streets, which operation was to be reviewed and inspected by the California Regional Water Quality Control Board and Solid Waste Management Board for compliance with the California Water Code, after which the W.Q.C.B. imposed a cease and desist on the landfill operation, and the site was not to accept any wastes until requirements were established by the Regional Water Quality Control Board.

Mr. Gonzales advised the California Regional Water Quality Control Board will not consider issuance of a permit on the operation of the landfill site until all local agencies with jurisdiction have approved the use of the site for the intended purpose.

Mr. Gonzales concluded the Planning Commission at a meeting held October 11, 1977, approved the Conditional Use Permit application, subject to findings and two conditions - 1) immediate prohibition of the use of Fernando and Flores Streets for access to the subject property; and 2) requirement for the property owner to acquire access rights furnishing protection to the existing residential neighborhood along Fernando and Flores Streets from heavy truck traffic and associated impacts of those operations, as outlined in Planning Commission Resolution No. 847.

Councilman Rehrer asked if the Regional Water Quality Control Board has now given their approval of this operation.

Mr. Gonzales answered no, they will not consider the application until approved by the local jurisdiction.

Mr. Ralph Guyaux, applicant and owner of the site, stated this property has been used as a landfill site for sometime, before he purchased the property, and he finds it rather ironic that the Crane Company has been dumping the very same kind of materials into the County Flood Control dykes for many years. Mr. Guyaux mentioned that the Water Quality Control Board has stated these materials may be detrimental, not that they are detrimental.

Councilwoman Cisneros stated she was very concerned for the residents, especially children, living on Fernando and Flores Streets, and the dangerous truck traffic being created by this operation. Mrs. Cisneros suggested that the applicant try to find an alternate route to the dump site.

Mr. Guyaux stated he is in the process of working out details with Southern Pacific Railroad Company to use a portion of their right-of-way as an alternate route to the dump site.

After additional discussion, moved by Councilwoman Cisneros, seconded by Councilman Rehrer, to deny Planning Commission Resolution No. 847, and refer this matter back to the Planning Commission and Staff for further review and consideration. Unanimous vote.

- - - - - - - - - - - - - - - - - -

ADJOURNMENT:

Moved by Councilman Hayes, seconded by Mayor Gonzales and unanimously passed, Mayor Gonzales adjourned the meeting at 9:30 p.m.

Control Board
1416 Ninth Street
Sacramento, CA 95814

Dear Mr. Bryson:

I have received complaints from constituents concerning a landfill operation at the end of Flores Street in Colton. Area residents complain that the landfill is a hazard to children, a blight on the neighborhood, and violates water quality standards. In addition, they allege that it does not have a conditional use permit.

I would appreciate your office looking into this matter as expeditiously as possible. Please let me know if you want additional information.

Very truly yours,

TERRY GOGGIN

PHONE: (714) 684-9330

February 17, 1978

Mr. Ralph Guyaux
P. O. Box 143
Colton, CA 92324

Dear Mr. Guyaux:

This will acknowledge receipt of the report of waste discharge for your landfill in Colton. However, the report is incomplete since all of the additional information requested in our letters of November 16, 1977, and January 18, 1978 (copies enclosed), has not been received. Therefore, you are requested to submit this information by February 24.

In our letter of January 18, 1978, you were requested to cease all discharge of wastes at the site. We have been informed by the City of Colton that the discharge of waste is continuing. As pointed out to you earlier, any discharge of waste such as this without waste discharge requirements is a violation of the California Water Code. Therefore, response to this matter is also requested by the above date.

Failure to submit all of the requested information by the above date will result in referral of this matter to the San Bernardino County District Attorney for enforcement.

If there are any questions, please contact this office.

Sincerely,

John M. Zasadzinski
Senior Engineer

Memo To File 2-17-78

Dwyane telephoned. Claimed he had not received any messages to contact the board since our meeting.

He has definitely stopped Crane Co's materials from coming into site.

He was vague about Griffin Wheel.

I told him he should clear up the matter regarding burning the dumpsite to Group 3 materials if he cannot develop good information for the industrial wastes as to their leachability.

He stated he would clear this up with a memo to be written this week-end. If we don't hear from him by 2-24-78 we will have to go to some sort of enforcement action.

PHONE: (714) 684-9330

December 23, 1981

Mr. Ralph Guyaux
P. O. Box 143
Colton, CA 92324

Dear Mr. Guyaux:

During a telephone conversation on December 15, 1981 with Gary Stewart of this office, you noted that the analyses we previously requested of the waste material deposited at your site have not yet been done. You stated that you are going to have the analyses performed immediately and requested information on the type of laboratory work required.

Before we respond to your laboratory question we must remind you that we cannot proceed with the processing of waste discharge requirements for your proposed landfill until all local agencies with jurisdiction have approved the use of the site for the intended purposes. We again stress that any discharge of waste, at this site, without waste discharge requirements is a violation of the California Water Code.

In regards to determining if the Griffin Wheel material which you have stored at the site is an inert, Group 3 waste, a leachate analysis will need to be performed. The electrical conductivity (EC) of a 1:5 extract in distilled water will need to be determined by a state approved laboratory. Secondly, we request that the concentrations of the individual heavy metals, as specified in the Resource Conservation and Recovery Act procedure be provided. This is a different leachate procedure than for salinity. Please be aware that if these sample results indicate any detrimental concentrations, these materials will have to be relocated to a proper disposal site.

In addition to the above, the material will need to be investigated by the San Bernardino County Department of Health Services, Toxic Control Section to verify that it will not fall under the classification of a hazardous waste. We suggest you contact Mr. Jon Kindschy at (714) 383-7170 regarding further details.

If there are any questions, please contact this office.

Sincerely,

John M. Zasadzinski
Senior Engineer

Attn: Mr. John M. Zasadzinski, Sr. Engr.

Dear Sir:

Please be advised that Colton Mfg. have been notified that they are no longer permitted to dispose of their broken molds and fixtures at the Florez site, and have agreed to stop.

There is no ash material from Griffin Wheel being disposed of at the Florez site at this time and for the past 6 months. I am having chemical tests made on the ash material from Griffin and will submit these to you before this material will again be brought in.

There is a lock on the gate to this property. The only people in and out are other property owners and people authorized to dump on my site.

Sincerely,

Ralph Guyaux

Mr. Guyaux returned my call this morning. He admitted that the material [illegible] was hauled to his site recently. However, he said that none of this was disposed of. It is being stored at the site for future recovery to extract the steel.

The material is apparently slag (slag, concrete, stone, steel). He is having a sample analyzed at a laboratory and will send us a copy of the analysis as soon as he gets it.

I spoke with Jim Agelera today regarding the subject. He said that his office received a similar complaint a couple of weeks ago, but when they went out to investigate, they could not find anything (natural ponding was covered up). When they received the recent complaint, they responded quickly and found [illegible] in the act". They found approx. 10 piles of black slag which had just been dumped. A police report was written and photos were taken.

Because of the past problems with the facility, Mr. Agelera refered the matter to the City Attorney for possible legal actions.

Dear Mr. Guyaux:

In our letter dated November 16, 1977 (copy enclosed), you were requested to submit information regarding your landfill in Colton. In our subsequent meeting on December 15, 1977, you were also requested to submit chemical leachate analyses of all industrial wastes which you proposed to discharge at the site. We have attempted to contact you by phone but the call was not returned. As of this date, the above requested information has not been received.

You should be aware that failure to submit such information when so requested is a violation of the California Water Code. You are again requested to submit this information.

You should also be aware that any materials disposed of at this site, which will not meet the criteria established in this Board's waste discharge requirements for this site, may have to be removed. Therefore, you should cease disposing of any materials at this site until the waste discharge requirements determine the site classification.

We suggest that you expedite the requested filing. If we have not received your completed report by February 1, 1978, we will initiate the enforcement procedures outlined in the California Water Code.

Sincerely,

John M. Zasadzinski
Senior Engineer

November 16, 1977

Mr. Ralph Guyaux
16955 Washington Street
Riverside, CA 92504

Dear Mr. Guyaux:

On November 2, 1977, staff members of this Board, the State Solid Waste Management Board, County of San Bernardino Environmental Improvement Agency, and the City of Colton conducted an inspection of your landfill operation in Colton.

For unknown reasons, your landfill is not covered by requirements from this Board and, as such, must be considered in violation of the State Water Code. It was apparent that most of the wastes discharged were of an industrial origin, with the major portion being plaster molds from Crane Co. A leachate sample of this molding material has been analyzed. The analysis indicates that this material is significantly soluble in water and, therefore, may adversely affect the quality of the waters of the State. We believe that a leachate analysis of the black ash material from Griffin Wheel Company may also have similar results. Therefore, you are requested not to accept any of these wastes at your site until waste discharge requirements are established by this Board. Our preliminary analysis indicates that the site could only receive Group II-2 or Group III solid wastes. Neither of these categories would allow water soluble materials.

Please complete the enclosed report of waste discharge and submit it with the appropriate filing fee. The following information will be necessary to supplement the report of waste discharge:

1) A list of all materials which are or have been disposed of at the landfill. The source of each type of material should be included.

2) A copy of all required city, county, and state permits relating to the operation of the landfill.

3) A chemical analysis of the leachate of the ash material from Griffin Wheel Company.

Incidentally, our inspection indicated that access to the site lacks controls so that items disposed of at the site could be a problem. This lack of controls is of concern to us. You are, therefore, requested to provide this office with comments on your plans to regulate the disposal of wastes at the site. Your report should also include the methods used to insure that chemical wastes will not be disposed of at the site.

Please provide the above information by November 30, 1977. If there are any questions, please contact this office.

Sincerely,

John M. Zasadzinski
Senior Engineer

PETITION IN OPPOSITION OF CONDITIONAL USE PERMIT:
File Index No. C-8-77

Mr. Williams, City Attorney, and City Council:

It has been quite a while since the residents of Florez Street met with the Colton Planning Commission and the City Attorney concerning the landfill and salvage operation.

First of all, we do not enjoy living in an ugly environment. Many of us have spent hard-earned money to improve our homes and our way of living. It is hard for our neighborhood to progress if the value of our homes doesn't increase because of the landfill and salvage yard operations. The landfill operation is one area that hasn't improved.

We are absolutely opposed to the large, 18-wheeler, trucks that speed down the road and only slow down at the other end of the street. Some of the residents complain that the trucks cause their homes to rumble and shake. They find it very disturbing and nerve-wracking. It may seem petty to other people but the residents of Florez Street consider this a very serious problem.

This week, as has been in the past, there is debris on our street which has fallen from and was brought out on the wheels of the trucks onto our street. The landfill or salvage operation owners never bother to clean it up until a complaint is issued. Then you see them out there cleaning up what they should have done on their own.

We have three reports on file with the Colton Police Department concerning property damage caused by Warren Duncan and the people he associates with. Mr. Duncan has never made an effort to reimburse

any of the residents for these damages. The most recent occurred on 8-16-77, when a 18-wheeler diesel truck making a pick-up could not get in because the yard was closed. The driver backed onto a lot and ran over a cement block which in turn displaced a surveyor stake which had been put there just two months earlier. Who will pay to have a surveyor party come and put the surveyor stake back in its proper place? The driver from A-1 Material said, "Talk to my boss about this." His boss said, "I'll check into it." That was the end of that.

Mr. Duncan, in conjunction with Mr. Ralph Guyaux, in regard to the landfill operation, have a permit for the present to dump dirt and rock. In the past and at the present time more than dirt and rock have been dumped there. (We have provided color slides of the land in question for the Planning Commission. We request that these be shown to the City Council.) We, the residents of Florez Street, are in complete opposition of allowing the salvage and landfill operation to exist, let alone for an extended permit to be issued which will enable them to expand.

The landfill operation in the past and at the present time is being used as a private dump for industrial waste. Battery casing, lumber from the salvage operation, plaster molds from a crane company, soot from Griffin Wheel Company and anything from the salvage operation that can't be used is dumped there. Don't we have a law against operating a private dump? Does Mr. Duncan and his associates have a right to operate such a dump in our neighborhood? Isn't the city and county losing revenue by allowing this operation to continue? We aren't dreaming any of this up. Again, please check

the color slides we have provided. They will confirm our statements.

At a meeting with the Planning Commission, an individual involved in the landfill operation revealed that he had plans to open an industrial type dump with the slag from Griffin Wheel Company being the bulk of the waste to be dumped..The slag and residue is a pollutant and the oxide dust travelling in open trucks and into the dump will end up on our streets, our clothes, and in our homes. Over a period of time this will become a major problem. We should solve the problem before it starts.

The landfill operation and the salvage operation seem to work together. Salvage is spread out all over the landfilled area. It is apparent that the salvage operation doesn't have anywhere else to go until the landfill operation spreads out. The salvage operation is spilling over the ridges as you can see in the slides.

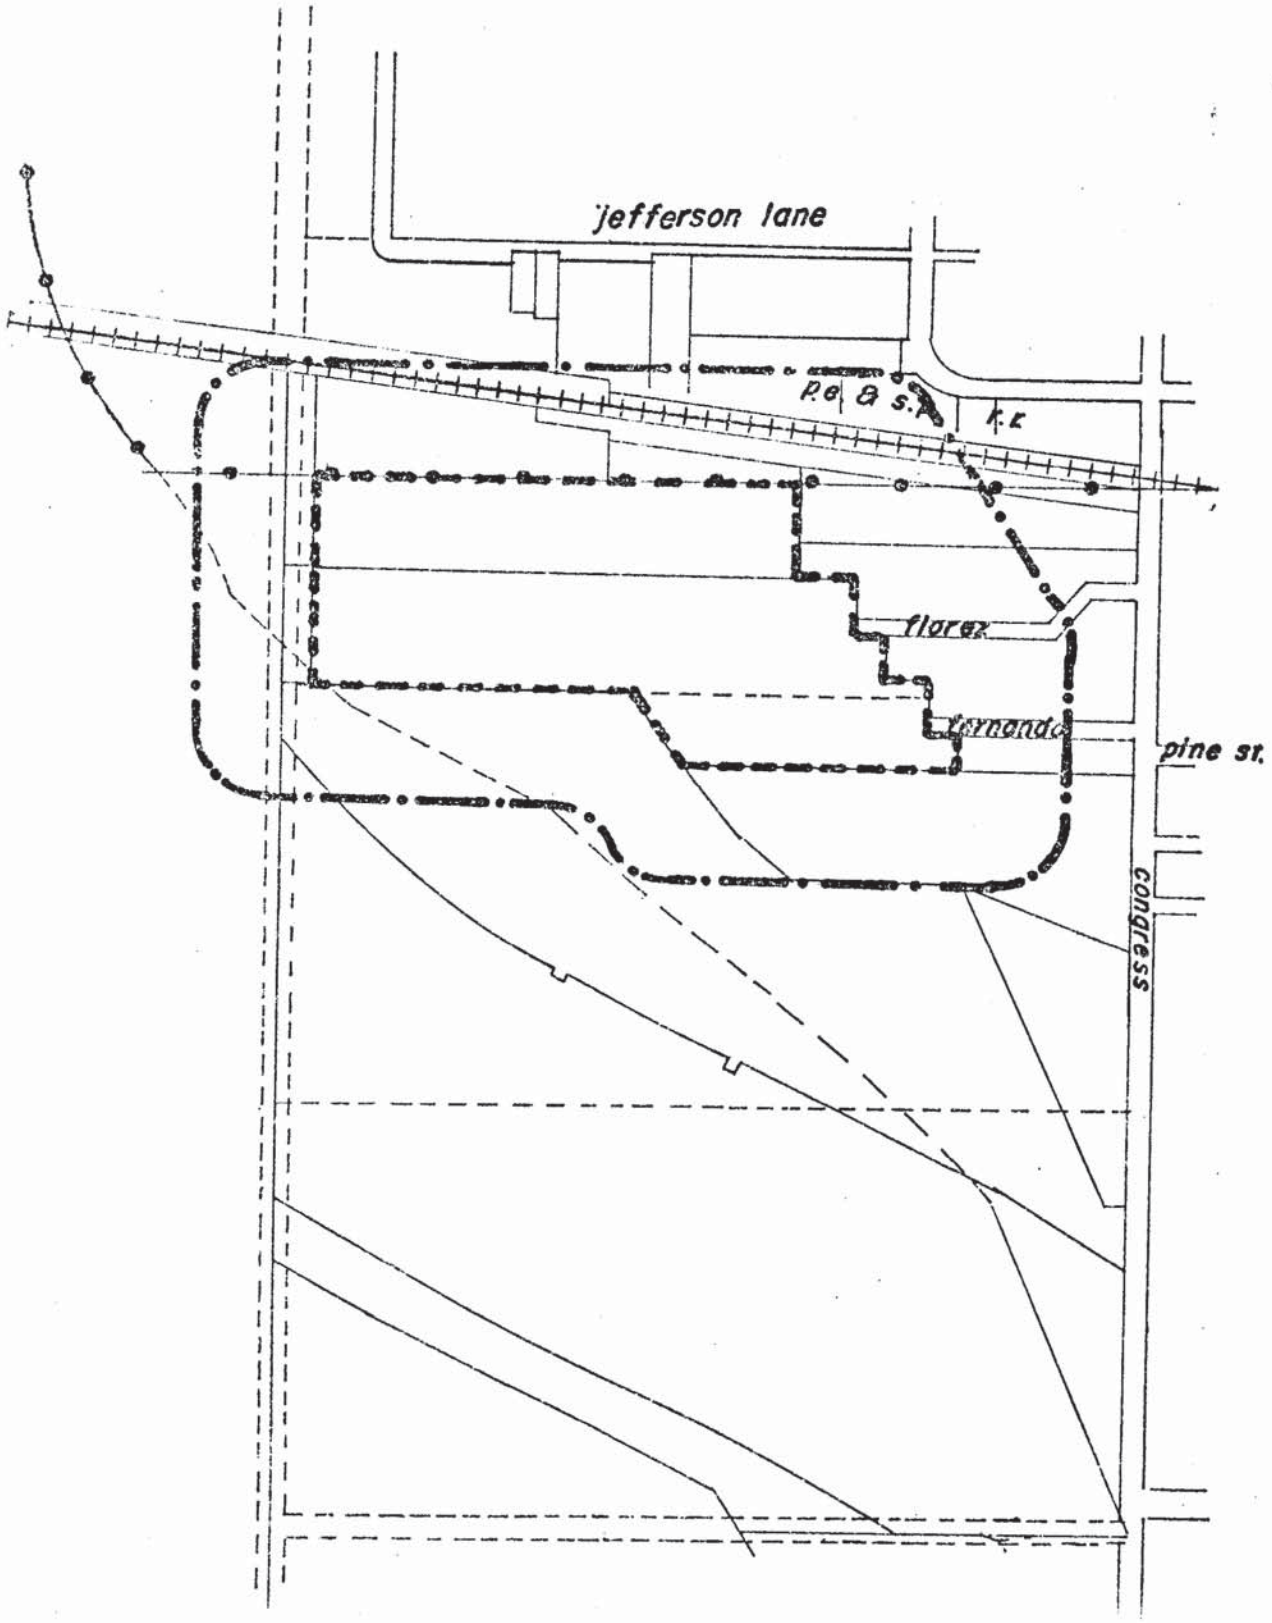
The traffic caused by the landfill and salvage operations is just to great to bear at times. When they are operating in full gear, we have truck traffic from sun up to sun down. We have many young children on Florez Street. It is not an easy task to watch them all of the time. The salvage operation is engaged in business with many people from Baja California, Mexico. They come speeding down the street as if it were freeway. Who would pay the hospital or perhaps even the burial bill if one of these people should hit

one of our children. We don't believe the landfill and salvage operations would help us out. Most of the drivers involved, if not all, drive like they are on a race way. We ask the members of the City Council, "When do we put a stop to this, when a child is killed or mamed for life? Would you wait this long to take action if it were your neighborhood?"

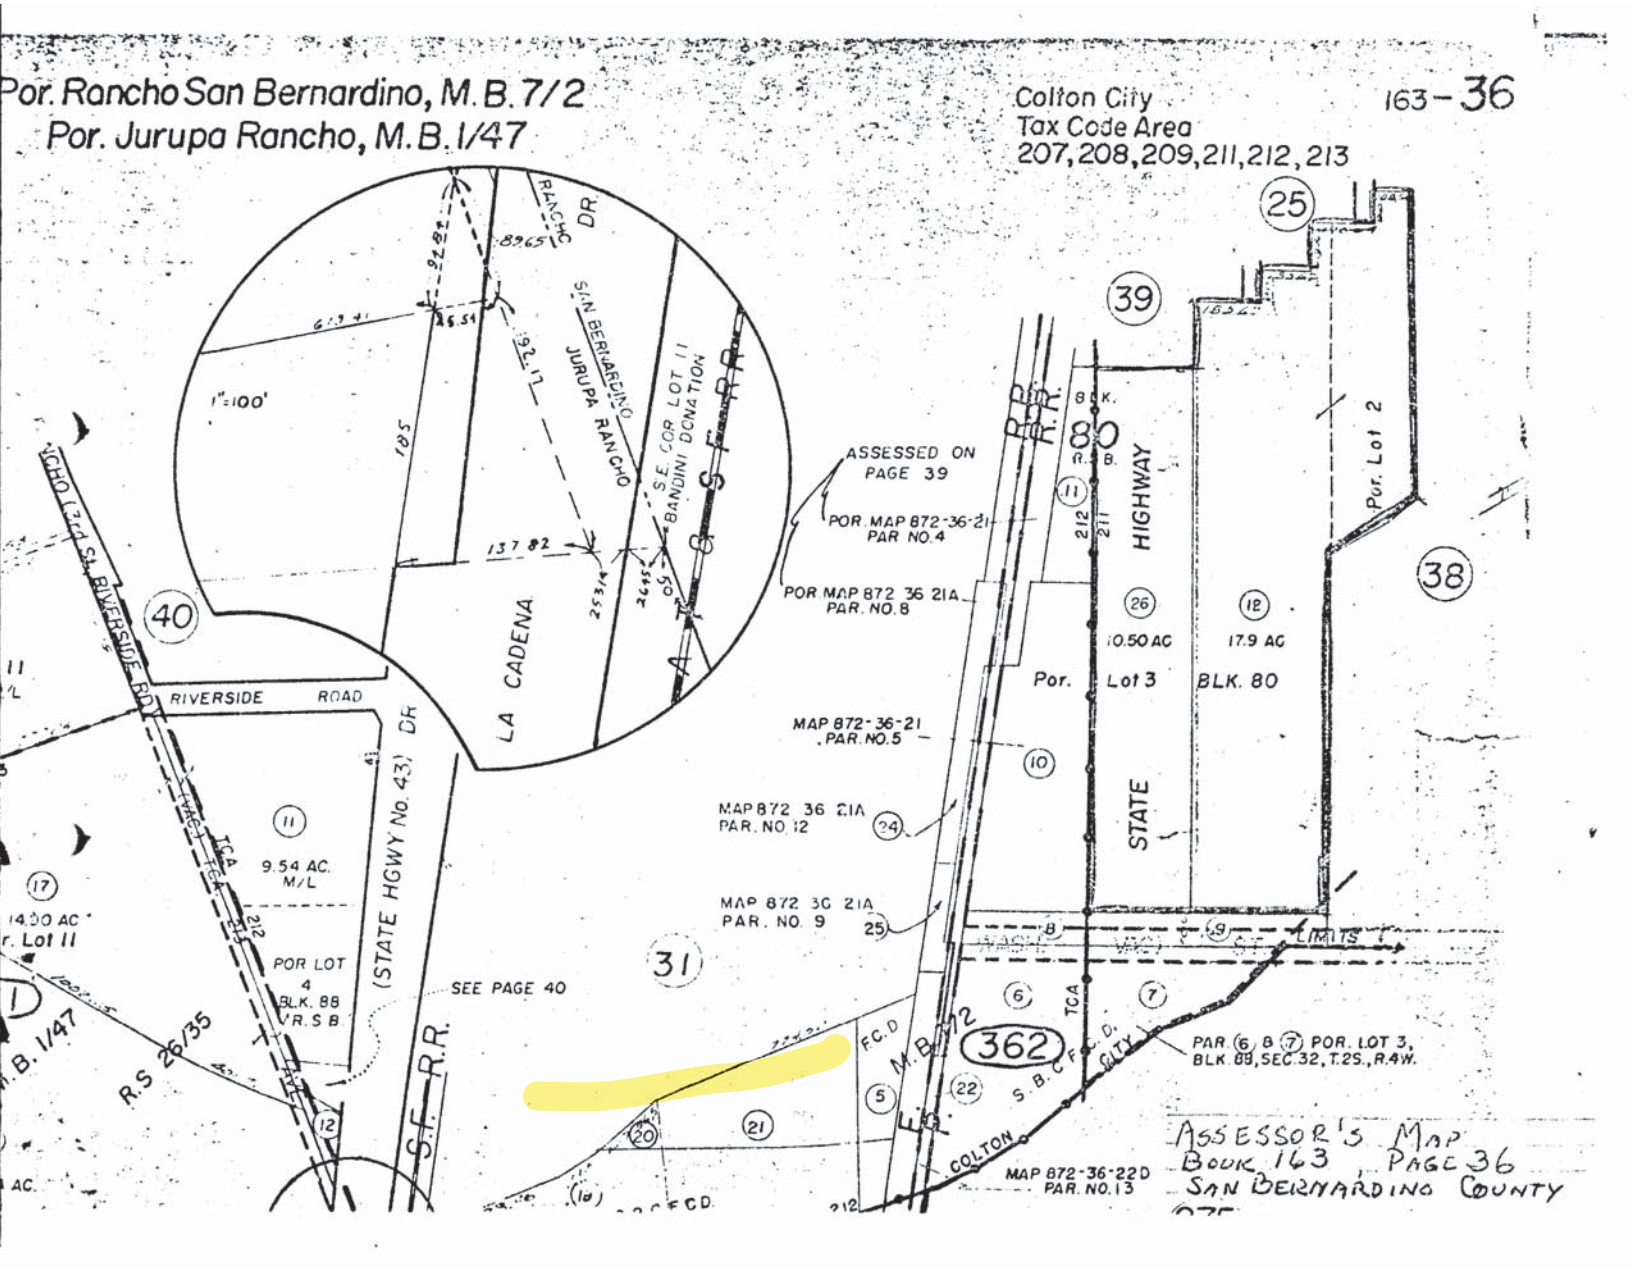
As home owners and tax payers, we protest the city condoning the operation of this illegal private industrial dump and salvage yard to continue on Florez Street. If indeed Mr. Davenport did have a license to operate a salvage yard on Florez Street prior to the zone change, was his license valid at the time of the change? Doesn't the city have a record of this? Doesn't Mr. Davenport have a record of this? If at the time of the zone change Mr. Davenport didn't have a valid license to operate a salvage yard on Florez Street, didn't he automatically lose his right to continue his salvage operation contrary to what his lawyer claims. We are not lawyers and we know Mr. Davenport may have some loop holes, but we firmly believe that the law can work for us, with the sincere help from our City Attorney, as it is working for Mr. Davenport.

We now ask the Planning Commission and City Council to please not issue a permit to Ralph Guyaux or his associates to continue their landfill operation. In the past we asked that an alternate route be established that would allow them access to their property so as to keep the big trucks off of our residential street. Our sug-

gestion was rejected.



We are also asking the Planning Commission and City Council to put speed bumps to slow down speeders who don't have any regard for the property of the residents of Florez Street. We also ask that the Police Department and City of Colton post weight limit signs on our street.



In addition, we ask that a fence like those around metal yards and other businesses of this nature be erected to cover the eye sore that has developed until this matter is settled. Just because we live in South Colton doesn't mean that we have to put up with these things in our neighborhood. The slides we have provided are numbered and you will be provided with an explanation for each slide.

We, the undersigned, are in complete accordancd with the terms of this petition.

TECHNICAL MEMORANDUM NO. 2B
SAWPA RIX DEMONSTRATION PROJECT

SUBJECT: SITE 2 HYDROGEOLOGICAL INVESTIGATION

PROJECT: LAO27558.A1

DATE: DECEMBER 21, 1989

PREPARED BY: GREG WOODSIDE
TERRY FOREMAN

REVIEWED BY: JIM BLOOMQUIST
FRITZ CARLSON

SANTA ANA REGION
REC'D DATE
DEC 08 1994
DBL 12/12
WMM

INTRODUCTION

This technical memorandum summarizes the hydrogeological investigations and findings of the area known as Site 2. Site 2 has been abandoned as a potential Rapid Infiltration/Extraction (RIX) facility because of a number of concerns identified during the conduct of the hydrogeological investigations. One of the more significant concerns is the presence of groundwater contamination by tetrachloroethane (also called perchloroethene, PCE). The Santa Ana Watershed Project Authority (SAWPA), its member agencies, and other state or local agencies may initiate activities to address this contamination. The information in this technical memorandum will provide a starting point for those activities.

BACKGROUND

Site 2 is an approximately 110-acre parcel located adjacent to the Santa Ana River in Colton, California. As seen in Figure 2B-1, the site is located east of La Cadena Avenue and on the northwest side of the river. The demonstration site is an approximately 10-acre portion of the larger Site 2 area. The larger area will be referred to as Site 2, and the smaller area will be referred to as the Demo Site herein as shown on Figure 2B-2.

Previous work indicated that Site 2 is favorable for the RIX process. The previous work consisted of a hydrogeological investigation by Schaefer Dixon Associates in conjunction with Metcalf and Eddy (M&E, 1988). Their investigation included cone penetrometer tests (CPT), soil borings, well installation, aquifer testing, and infiltration tests. Data were collected over Site 2, but limited work was done on the Demo Site. The previous work also included a two-dimensional groundwater flow model of RIX at Site 2. Groundwater quality data were not collected during the previous work.

Rix project takes 2ndary effluent east of ~~site~~ from San Bardo treatment plant, runs along river, south of Guyaux, thru hole near plexco, ~~xxxx~~ under La Cadena, to Colton plant, receives more effluent, finally discharges to percolation ponds west of Colton facility

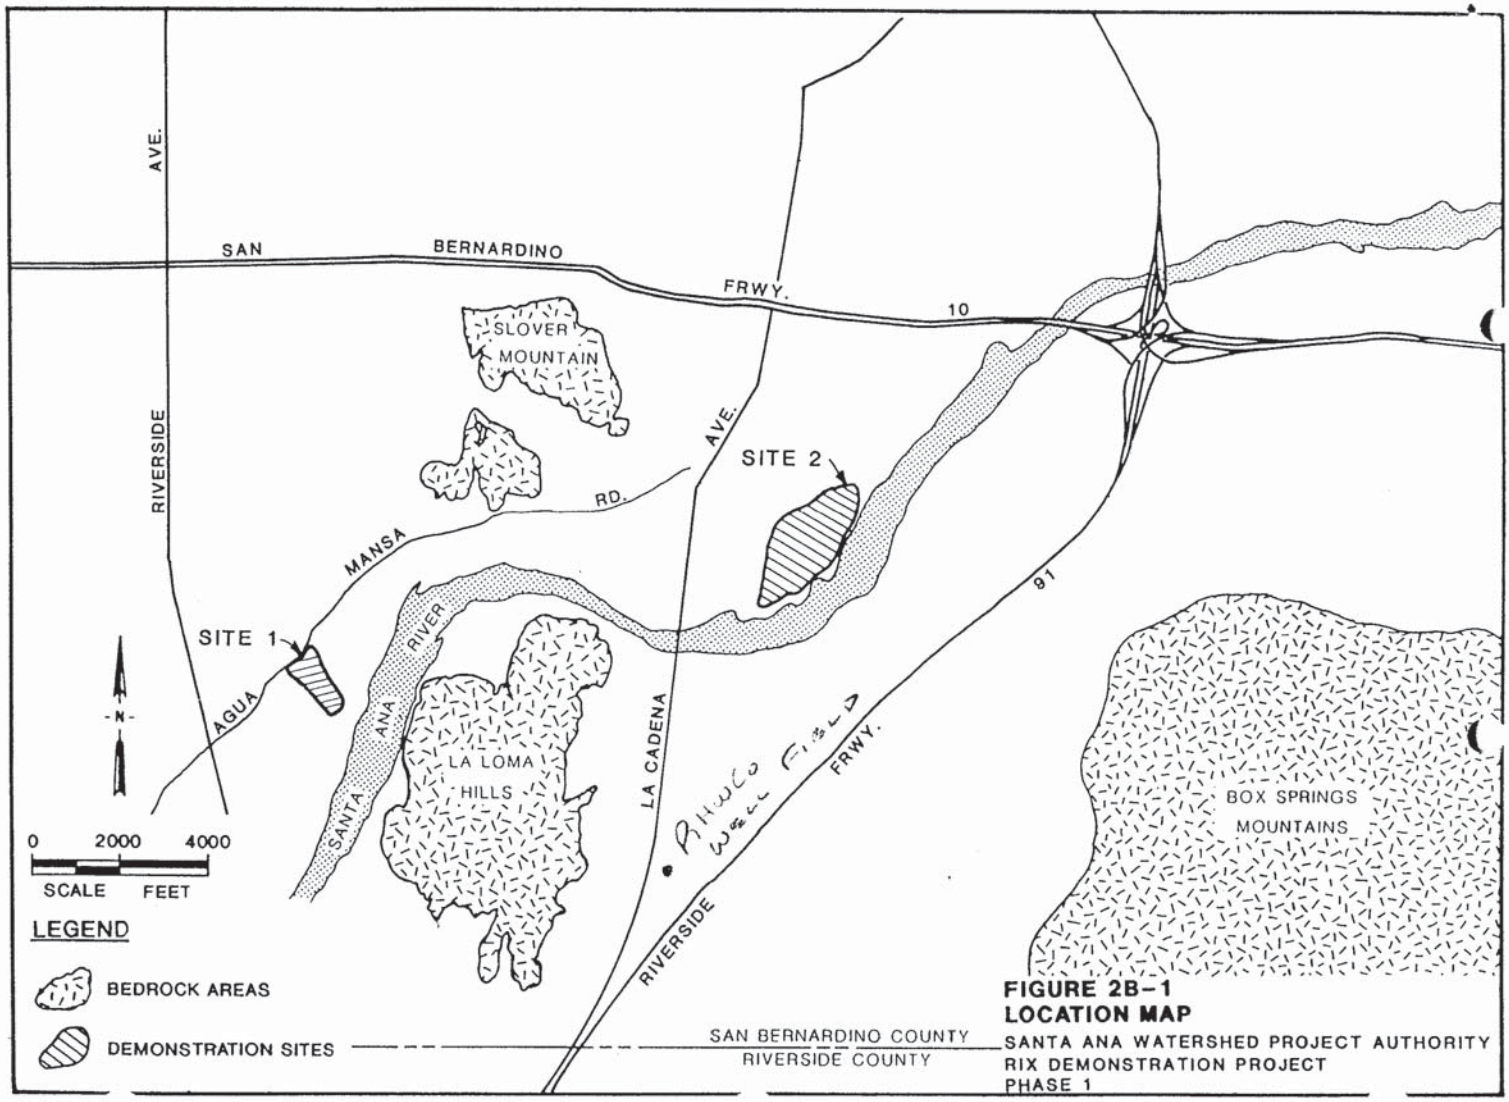

FIGURE 2B-1

RIX DEMONSTRATION PROJECT
PHASE 1

CH2M HILL conducted additional hydrogeological investigations of the Demo Site to obtain data for design purposes. Several issues developed during the hydrogeologic investigation of the Demo Site that resulted in an expansion of the scope of work. These issues are:

1. The availability of the 44-acre Riverside property located adjacent to the Demo Site. This property is required to implement the full-scale RIX facility if all the City of San Bernardino Wastewater Treatment Plant secondary effluent is treated at Site 1 (ultimate flow projected at 43 million gallons per day [mgd]).

2. The nature of a dump site on the west side of the Demo Site but contained within the boundary of Site 2.

3. The presence of a zone of fine-grained sediments with unfavorable water transmitting properties located in the subsurface of the Demo Site.

4. The occurrence of volatile organic compounds (VOCs) in monitoring wells installed at Site 2.

SAWPA authorized a second phase of work to further address these issues.

PURPOSE

The purpose of the hydrogeological investigation is twofold:

1. To provide the hydrogeological information necessary to design the extraction and monitoring systems for the RIX demonstration project.

2. To establish background groundwater quality conditions.

SCOPE

Two phases of work were completed at the Demo Site because of the potentially unfavorable hydrogeologic conditions indicated by the first phase. The first phase of work was conducted on the Demo Site only. The second phase included work outside the Demo Site.

Phase 1 work consisted of the following:

1. Review background information on the regional and local hydrogeology. Information reviewed included previous consultants' work, drillers' well logs, and publications describing the regional hydrogeology.

2. Drill two borings and describe the sediments encountered during the borings; install a monitoring well in each of these borings.

3. Drill a pilot hole to 105 feet and describe sediments encountered during drilling; install one 8-inch-diameter extraction well at the same location.

4. Measure groundwater levels to estimate the hydraulic gradient to assess the direction and rate of groundwater movement.

5. Conduct a long-term aquifer test to estimate the water storage and transmitting properties of the alluvial sediments.

6. Collect samples from the monitoring wells to establish background groundwater quality. Samples are collected on a quarterly basis prior to the operation of the demonstration project.

7. Evaluate field data to describe the hydrogeology and groundwater quality.

8. Develop a groundwater model of the site to assist in the design of the extraction system and monitoring system for the RIX demonstration project.

9. Conduct a geochemical evaluation to assess potential fatal flaws with respect to the geochemical processes.

10. Prepare a technical memorandum describing the results of the work.

Based on the findings of the Phase 1 work, CH2M HILL recommended additional soil borings, aquifer testing, and water quality sampling prior to proceeding with items 8 and 9 above. Phase 2 work consisted of the following:

1. Three additional borings on the Demo Site

2. One aquifer test on the Demo Site

3. Four additional borings on the remainder of Site 2

4. Two aquifer tests on the remainder of Site 2

5. One groundwater sample downgradient of a dump site

6. Evaluation of Phase 2 data and preparation of a technical memorandum on findings and recommendations

Based on the findings of the hydrogeology investigation as summarized in a November 3, 1989, memorandum, items 8 and 9 of Phase 1 will not be completed.

HYDROGEOLOGY

This section describes the hydrogeology of the site. The regional setting is described, followed by a discussion of the site hydrogeology. The discussion of the site hydrogeology includes a description of the site physiography and land use, subsurface stratigraphy, hydrogeologic properties, groundwater flow conditions, and groundwater quality.

REGIONAL SETTING

The site is located in the Riverside North groundwater basin. This basin is filled with alluvial sediments that extend up to 800 feet below the ground surface, where bedrock is encountered. The alluvial sediments consist of recent sediments deposited by the Santa Ana River and its tributaries and older alluvium. The basin is bounded by bedrock areas to the south (the Box Springs Mountains) and to the southwest (the La Loma Hills) as shown in Figure 2B-1. Bedrock areas also occur within the basin to the west of the site (Slover Mountain). Generally, bedrock consists of crystalline rocks that yield small amounts of water to wells (in the range of 1 to 10 gallons per minute [gpm]) compared to the alluvial sediments that yield larger amounts of water to wells (in the range of 100 to 1,000 gpm or more).

The depth to groundwater in the alluvial sediments varies from several hundred feet to a few tens of feet below the ground surface. The shallowest depths to groundwater generally occur near the Santa Ana River. Production wells produce from 100 to 400 feet below the ground surface with specific capacities of 18 to 104 gpm per foot of drawdown (gpm/ft) (James M. Montgomery, 1987).

SITE HYDROGEOLOGY

This section discusses the site hydrogeology. The site physiography and land use are described first, followed by discussions of the subsurface stratigraphy, hydrogeologic properties, groundwater flow conditions, and groundwater quality.

SITE PHYSIOGRAPHY AND LAND USE

Site 2 is in the Santa Ana River floodplain on the northwest side of the river. The land surface is generally flat except for small ephemeral washes that traverse the site. The slope of the land surface is about 0.003 foot/foot (15 feet per mile) to the

southwest. Over most of the site, the topsoil is sand and silty sand; and vegetation is scrub brush with only a few trees. Residential areas exist on the northern edge of the site along with light industry such as construction yards, wrecking yards, and a dry cleaner. A dump is on the northern edge of the site adjacent to the demonstration area as shown in Figure 2B-2. Debris at the dump includes old vehicles, piles of a slag-type material, and construction debris.

STRATIGRAPHY

Previous work on the site included borings and cone penetrometer tests (Metcalf and Eddy, 1988). Indirect information about subsurface conditions is supplied by the CPT data because sediment types are inferred from the tests and sediment samples are not recovered. Data from the previous CPT investigation generally does not extend below 25 feet because the cone penetrometer cannot penetrate cobble zones. The locations of borings, wells, and CPT data from the previous work and this hydrogeological investigation are compiled in Figure 2B-2. The field procedures followed during drilling and other field activities are discussed in Appendix A. Geologic logs of the borings drilled in this work are in Appendix B. Locations of geologic cross sections and generalized sediment types are shown in Figure 2B-2.

Figure 2B-3 is a cross section approximately parallel to the river along the northern edge of the site. Figures 2B-4 and 2B-5 contain three cross sections illustrating subsurface conditions at various locations. These cross sections indicate the following:

1. A fine-grained zone consisting of silt and clay is encountered at about 35 feet below ground surface on the Demo Site.

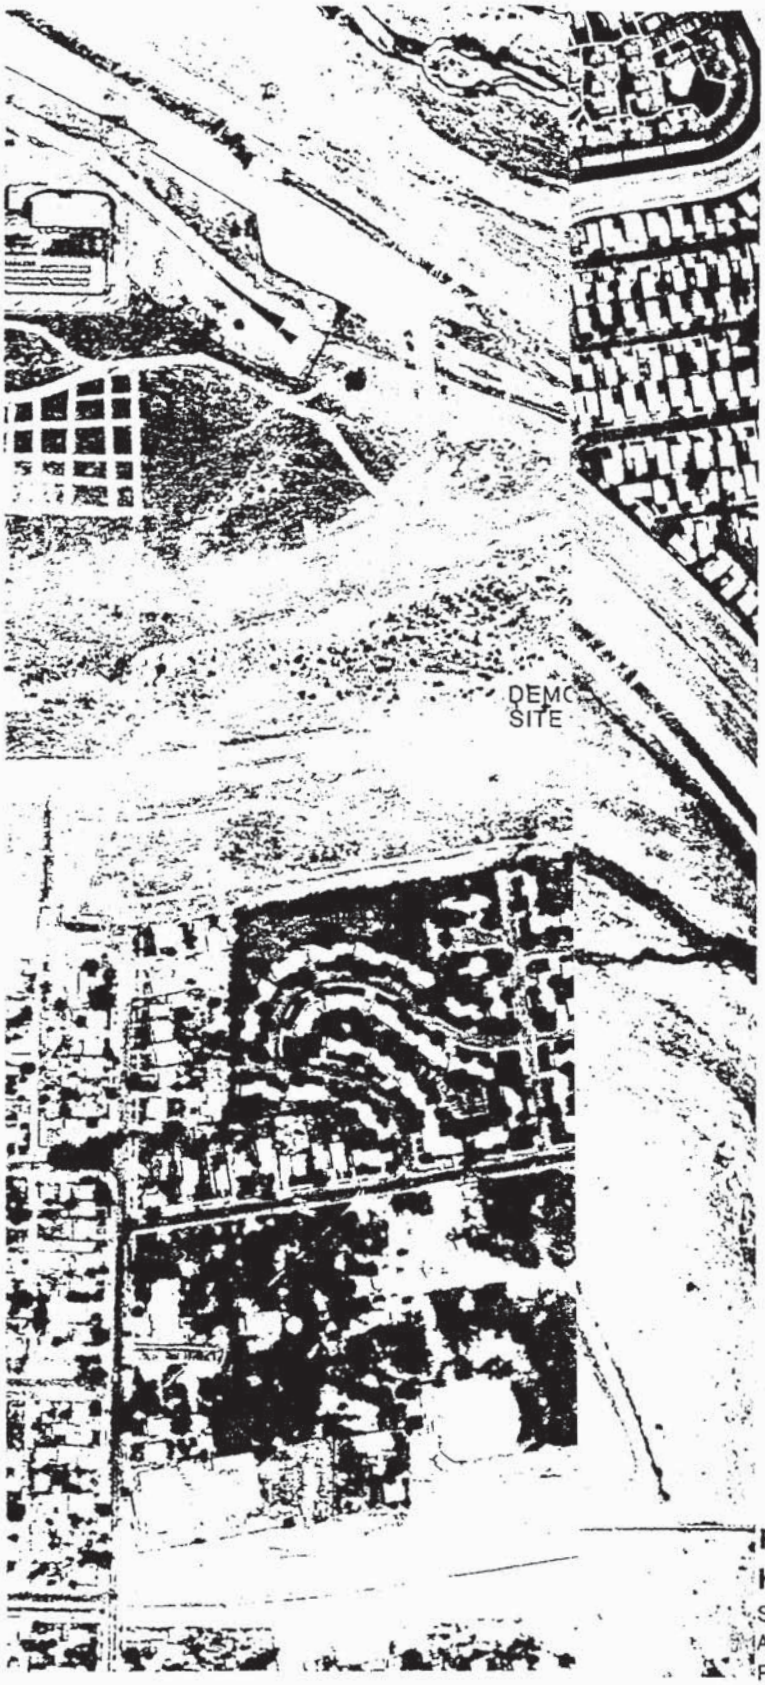
2. The zone of fine-grained sediments is estimated to extend to the east as shown in Figure 2B-2.

3. Medium to coarse sand occurs throughout the area outside the fine-grained zone except for thin silt and clay layers and cobble zones. Cobble zones are mostly 1 to 4 feet thick and are most prevalent closer to the Santa Ana River.

HYDROGEOLOGIC PROPERTIES

Aquifer tests were performed to estimate the water storage and transmitting properties of the subsurface sediments. These tests were conducted at wells EW-1, MW-4B, MW-5, A-1, A-2, and A-3 and consisted of pumping groundwater from each well and measuring

The estimated transmissivity, hydraulic conductivity, and storage coefficient values are summarized in Figure 2B-10. The hydrogeologic test data indicate the following:



1. The zone of fine-grained sediments encountered on the Demo Site at a depth of about 30 feet have a low K_h value, which is several orders of magnitude lower than the surrounding sediments. This zone is expected to significantly retard the vertical movement of groundwater.

2. Tests were not conducted in the unsaturated zone above the zone of fine-grained sediments. However, based on the nature of the sediments as observed from the borings and the infiltration tests, the K_h of this zone is anticipated to be similar to the K_h of the more permeable sediments (e.g. similar to P-1 and P-2).

3. Outside the area underlain by the fine-grained sediments, the K_h is high, and probably ranges from 100 to 400 ft/day in the sandy sediments. The K_h of the cobble zones may be as high as 1,000 ft/day.

GROUNDWATER FLOW CONDITIONS

Groundwater level measurements have been collected in all the wells shown in Figure 2B-2. These data are used along with the estimated hydraulic conductivity values to estimate the direction and rate of groundwater movement. Figure 2B-10 shows the groundwater elevation at four of the monitoring wells and the direction of groundwater flow based on the monitoring wells. The hydraulic gradient is approximately 0.003 to the southwest. Based on the estimated hydraulic conductivity for the sandy, coarse sediments to the east of the area containing the fine-grained sediments, the rate of groundwater movement ranges from about 1.5 to 6 ft/day, assuming an effective porosity of 0.2. Data are not available on the vertical gradient. However, the vertical movement of groundwater is anticipated to be much less than the horizontal movement because of the occurrence of the low hydraulic conductivity silt and clay layers as seen in Figures 2B-3 through 2B-5.

RECOMMENDATIONS

Based on the findings in this investigation, it is recommended that:

1. Site 2 be abandoned as a RIX facility

2. The contamination problem should be referred to the Regional Water Quality Control Board for further action

FIELD PROCEDURES

APPENDIX 2B-A
FIELD PROCEDURES

INTRODUCTION

This appendix describes the procedures followed during field activities. These activities consisted of drilling borings, installing and developing monitoring wells, drilling and installing an extraction well, developing an extraction well, testing aquifers, and sampling groundwater from monitoring wells.

BORINGS WITH HOLLOW STEM AUGERS

Borings were drilled with 4-inch, hollow-stem augers. Samples were taken every 5 feet with a 18-inch-long split-spoon sampler. When the sampler was driven into the formation, the blow count was recorded in 6-inch intervals. During boring B-1, a 5-foot-long continuous sampler was initially used to attempt to sample more of the formation. However, recovery in the continuous sampler was less than 1 foot in most intervals because of bridging by cobbles in the sampler. Therefore, the continuous sampler was used only in the upper 20 feet of boring B-1. In some intervals of the borings, a 5-foot-long split-spoon sampler was driven into the formation to attempt to sample more of the formation. Samples were logged in the field, and samples were collected in plastic bags every 5 feet or at a change in lithology. Representative samples for grain-size analysis and geochemical analysis were selected after the Phase 1 borings were completed.

Samples collected from the borings were logged based on the following characteristics:

- Sediment type (e.g., clay, silt, sand) was noted by determining the relative amount of each grain size. Each sample was classified based on the most prevalent grain size. For example, if a sample contained 50 percent sand, 35 percent clay, and 15 percent silt, the sample would be referred to as a sand. If a grain size occurs as greater than 15 percent of the sample, such as silt in the above example, this grain size is included in the description of the sample. If a grain size occurs as less than or equal to 15 percent of the sample, this grain size is included in the description of the sample with the adjective "slightly." In the above example, the sample would be classified as: sand, with clay, slightly silty. The maximum size of the gravel is recorded in inches, and the amount of gravel is recorded by percent.

- The mineralogy of the sand and gravel fraction of each sample was recorded.

- The consistency of the sample was noted by determining whether the sample was loose, slightly consolidated, or consolidated.

- The moisture content of the sample was noted by determining if the sample was dry, slightly damp, damp, or wet.

- The color of each sample was also recorded.

The drill rig bounced and chattered when cobble zones were encountered during drilling. The presence of these zones was noted on the boring logs. Each boring was drilled to 75 feet if possible. However, the presence of cobble zones at about 65 feet over much of the site prevented drilling to 75 feet at some of the borings. Large cobbles were encountered at 40 to 45 feet in boring MW-4, which the drill rig could not drill through; and the boring was abandoned. A second boring approximately 10 feet away encountered a similar obstruction at 47 to 48 feet and was also abandoned. At boring B-3, large cobbles were encountered at 17 feet, which the drill rig could not drill through. A second boring about 10 feet away was drilled to 21 feet but could not drill through a cobble zone at 21 to 22 feet and was abandoned. The depth of each boring is shown in Table 2B-1 of this memorandum. Borings where monitoring wells were not installed were backfilled with grout.

After completion of drilling at one hole, drilling equipment was steam-cleaned before moving to the next hole.

INSTALLATION OF MONITORING WELLS

Two monitoring wells were installed during the Phase 1 field activities at Site 2 and three temporary monitoring wells were installed during Phase 2 activities. The discussion below describes the installation of the two monitoring wells installed during the Phase 1 activities. After drilling and sampling with 4-inch augers, the borings were reamed out with 8-inch augers prior to installing the monitoring wells. Monitoring wells were constructed with 4-inch Schedule 40 polyvinyl chloride (PVC) casing with threaded fittings and 4-inch Schedule 40 PVC slotted well screen, with 0.020-inch slot size. The well screen generally extended from the water table to 20 feet below the water table. Five feet of blank PVC casing were installed below the well screen to serve as a sediment trap. Sand filter pack consisting of Monterey No. 3 sand extended from the bottom of the sediment trap to at least 5 feet above the top of the well screen. A 2-foot-thick bentonite clay seal was placed on top of

the sand pack. The annulus was filled with cement grout, which consisted of 5 percent bentonite and 95 percent type II Portland cement, from the top of the bentonite seal to the ground surface. The depth of each well and screened interval are shown in Table 2B-1.

The wellhead consisted of an approximately 6-inch-thick concrete pad with a steel riser pipe with locking cap over the top of the casing. Three grout-filled steel pipes were placed in the ground around each monitoring well. The construction of the temporary monitoring wells during the Phase 2 activities was similar to the two monitoring wells installed during the Phase 1 activities, except that a bentonite seal and cement grout were not installed; and the casing and well screen were removed from the boring after the tests performed with the temporary wells were completed. The boreholes were grouted after the temporary wells were removed.

DEVELOPMENT OF MONITORING WELLS

Development of the monitoring wells consisted of surging with a surge block, bailing, and pumping and surging with a submersible pump. After the well screen and casing were installed, the well was initially developed by surging the well with a surge block to draw the fine sediments around the well annulus into the well. The surge block was lowered to the bottom of the well and rapidly removed about 10 times to surge the well. A bailer was then lowered into the well, and the sediment in the well was bailed out. The amount of sediment in each well was variable, but the sediment in the wells was removed after about 10 bails on average. After bailing the sediment, the well was surged again with the surge block and the sediment removed with the bailer. The amount of sediment drawn into the well during the second period of surging was generally small. After the sediment was bailed, a submersible pump was lowered into the well; and the well was surged by turning the pump on and off. The well was surged in this manner until the discharge was relatively clear of silt and clay. The period of time each well was pumped generally averaged 2 hours.

DRILLING OF EXTRACTION WELL

The extraction well (EW-1) was drilled with a mud-rotary drill rig. A 14-inch-diameter steel conductor casing was set from the ground surface to 18 feet below the ground surface. The conductor casing was set by drilling to 18 feet with air circulation to remove the cuttings and pressure grouting the casing with cement grout. A 12-inch-diameter pilot hole was drilled to 105 feet with mud circulation to remove the cuttings. Samples were taken every 5 feet by filling a bucket with drilling mud as the mud flowed out of the pilot hole. Samples were logged in the

field and were collected in plastic bags. Samples were logged based on sediment type, color, and mineralogy as discussed above for the hollow-stem auger borings. During mud rotary drilling, samples are disaggregated; and the presence of thin silt or clay layers is not easily determined. The drill rig bounced and chattered when cobble zones were encountered during drilling, and the presence of these zones was noted on the geologic log.

INSTALLATION OF EXTRACTION WELL

After drilling the pilot hole to 105 feet, the extraction well was installed. The grain size of the sand filter pack and the size of the well screen were designed based on grain-size analyses of sediment samples recovered during drilling. The sand filter pack consisted of Monterey No. 3 sand. The well screen was of the steel wire-wound construction type with 0.030-inch slot size. Well screen and blank casing were 8-inch diameter. The well was screened from 39 to 97 feet below the ground surface. A 5-foot sediment trap was constructed below the well screen.

The sand filter pack was tremmied down the annulus through a tremmie pipe and extended from the bottom of the sediment trap to about 5 feet above the top of the well screen. An approximately 2-foot-thick bentonite seal was emplaced on top of the gravel pack. Cement grout was put in the well annulus from the top of the bentonite seal to the ground surface.

DEVELOPMENT OF EXTRACTION WELL

Development of the extraction well consisted of surging with a surge block, bailing, and pumping and surging with a submersible pump. The well was initially developed by surging the well with a surge block to draw the fine sediments around the well annulus into the well. The well was surged in 10-foot intervals by lowering the surge block to the bottom of each interval and rapidly removing it. Each 10-foot interval was surged about 10 times in this manner. The bailer was then lowered into the well, and the sediment in the well was bailed. However, as the sediment was being bailed out, cobbles up to 2 inches in diameter were bailed out. This suggested that the well screen or casing was damaged during the well installation. A well video-log was performed, but the video camera could not go deeper than 94 feet because of sediment in the bottom of the well. In the top 94 feet, no damage to the well screen or casing was detected. The bottom 8 to 10 feet of the well was then grouted with cement grout, and the well was surged and bailed again.

The next stage in the well development was pumping and surging with a submersible pump. The pump was lowered into the well, and

the well was surged by turning the pump on and off. Initially the water pumped from the well was muddy with some sand. As the well was surged by turning the pump off and on, the specific capacity of the well increased; and the amount of sediment in the water decreased. After about 5 hours of pumping, the specific capacity had increased from about 10 gallons per minute (gpm) per foot of drawdown to 22 gpm per foot of drawdown. The amount of sand pumped by the well had also decreased to 0.2 milligrams per 5 gallons of water.

AQUIFER TESTS

Aquifer tests were performed with the extraction well and with the monitoring wells. The aquifer test with the extraction well will be described first.

Before starting the pump in the extraction well, groundwater levels were measured in the extraction well and the monitoring wells (MW-4B, MW-5, P-1, and P-2). Groundwater levels were measured with an electric sounder. The measuring point for each well was the top of the casing. Groundwater levels were measured in the extraction well and in MW-5 from the time the pump was turned on according to the following schedule:

- Every 1 minute for the first 10 minutes of pumping
- Every 2 minutes for the next 10 minutes of pumping
- Every 5 minutes for the next 40 minutes of pumping
- Every 10 minutes for the next 3 hours of pumping
- Every 30 minutes for the next 3 hours of pumping
- Then every 60 minutes until the pump was turned off

Groundwater levels were recorded in MW-4B, P-1, and P-2 every 1 hour. The data recorded were the time and groundwater level. Drawdown was calculated by subtracting the groundwater level during pumping from the static groundwater level before pumping began. The discharge rate was measured with a flowmeter in gpm, and the discharge was transmitted through plastic hose about 350 feet away from the well toward the southwest before it was discharged to the ground surface.

Two tests were performed with the extraction well because the first test was interrupted when the electric generator quit running. The first test lasted approximately 32 hours while the second test lasted approximately 48 hours. After the well was turned off, groundwater levels were also recorded to the extent possible (the extraction well recovered very rapidly, making it difficult to accurately measure groundwater levels during recovery).

Aquifer tests conducted with the monitoring wells consisted of pumping the monitoring wells and measuring groundwater levels in

the pumping well. In wells A-1, A-2, and A-3, the tests lasted about 2 hours. Groundwater level measurements during pumping were generally taken on the same schedule as for the extraction well discussed above. Discharge rates were measured with a flow meter in gpm, and discharge was transmitted about 50 feet away from the well before it was discharged to the ground. After the pump was turned off, groundwater levels recovered very rapidly making it difficult to record groundwater levels during recovery.

In wells MW-4B and MW-5, pumping at 5 gpm caused the groundwater level to decline below the pump within 2 minutes. These tests consisted of pumping the wells until the groundwater level was reduced below the level of the pump, turning the pump off, and recording groundwater level measurements during the recovery period. Groundwater level measurements were recorded during recovery every 1 minute until the groundwater level had recovered to 95 percent of the initial static groundwater level.

SAMPLING GROUNDWATER FROM MONITORING WELLS

The procedures followed during sampling of the monitoring wells are described in Technical Memorandum No. 8, Groundwater Quality Monitoring Plan.

PRELIMINARY ASSESSMENT REPORT
GUYAUX LANDFILL
(EPA ID NO. CAD983652033)

1.0 INTRODUCTION

The U.S. Environmental Protection Agency (EPA), Region IX Site Evaluation Section, under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA) has tasked Roy F. Weston, Inc. (WESTON®) to conduct a Preliminary Assessment (PA) at Guyaux Landfill in Colton, San Bernardino County, California.

The purpose of a PA is to review existing information available on the site and is environs to assess the threat(s), if any, posed to public health or the environment and to determine if further investigation under CERCLA/SARA is warranted. The scope of this PA included a review of information available from federal, state, and local agencies, completion of a comprehensive target survey and performance of an onsite reconnaissance visit.

Using these sources of information, the site is then evaluated using EPA's Hazard Ranking System (HRS) criteria to assess the relative threat associated with actual or potential releases of hazardous substances at the site. The HRS has been adopted by the EPA to help set priorities for further evaluation and eventual remedial action at hazardous waste sites. The HRS is the primary method of determining a site's eligibility for placement on EPA's National Priorities List (NPL) which identifies sites at which EPA may conduct remedial response actions. This report summarizes the findings of these preliminary investigative activities.

1.1 Apparent Problem

The Guyaux Landfill (Guyaux) was identified as a potential hazardous waste site and entered into the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database in December 1992, following receipt by EPA of a Potential Hazardous Waste Site Identification Form from WESTON, an EPA Alternative Remedial Contract Strategy (ARCS) contractor, during their work on the Griffin Wheel Dump (EPA ID No. CAD9836337-44). This form reported that wastes had been reportedly deposited at the site without a permit. The wastes appeared to be from the Crane Company (EPA ID No. CAD066135690) and from Griffin Wheel Company, both located in Colton, California. Available information indicated that wastes of similar type from Griffin Wheel Dump were known to contain elevated levels of arsenic, copper, zinc, lead, cadmium, and chromium.[1]

2.0 SITE DESCRIPTION

This section describes the location, site specifics, operational history, and regulatory involvement at Guyaux based upon available information obtained during the PA.

2.1 Location

The Guyaux site is located at the end of Florez and Fernando Streets in Colton, California (Latitude: 34°03'13.0"; Longitude: 117°19'18.2").[2,3] The site location is shown in Figure 1.

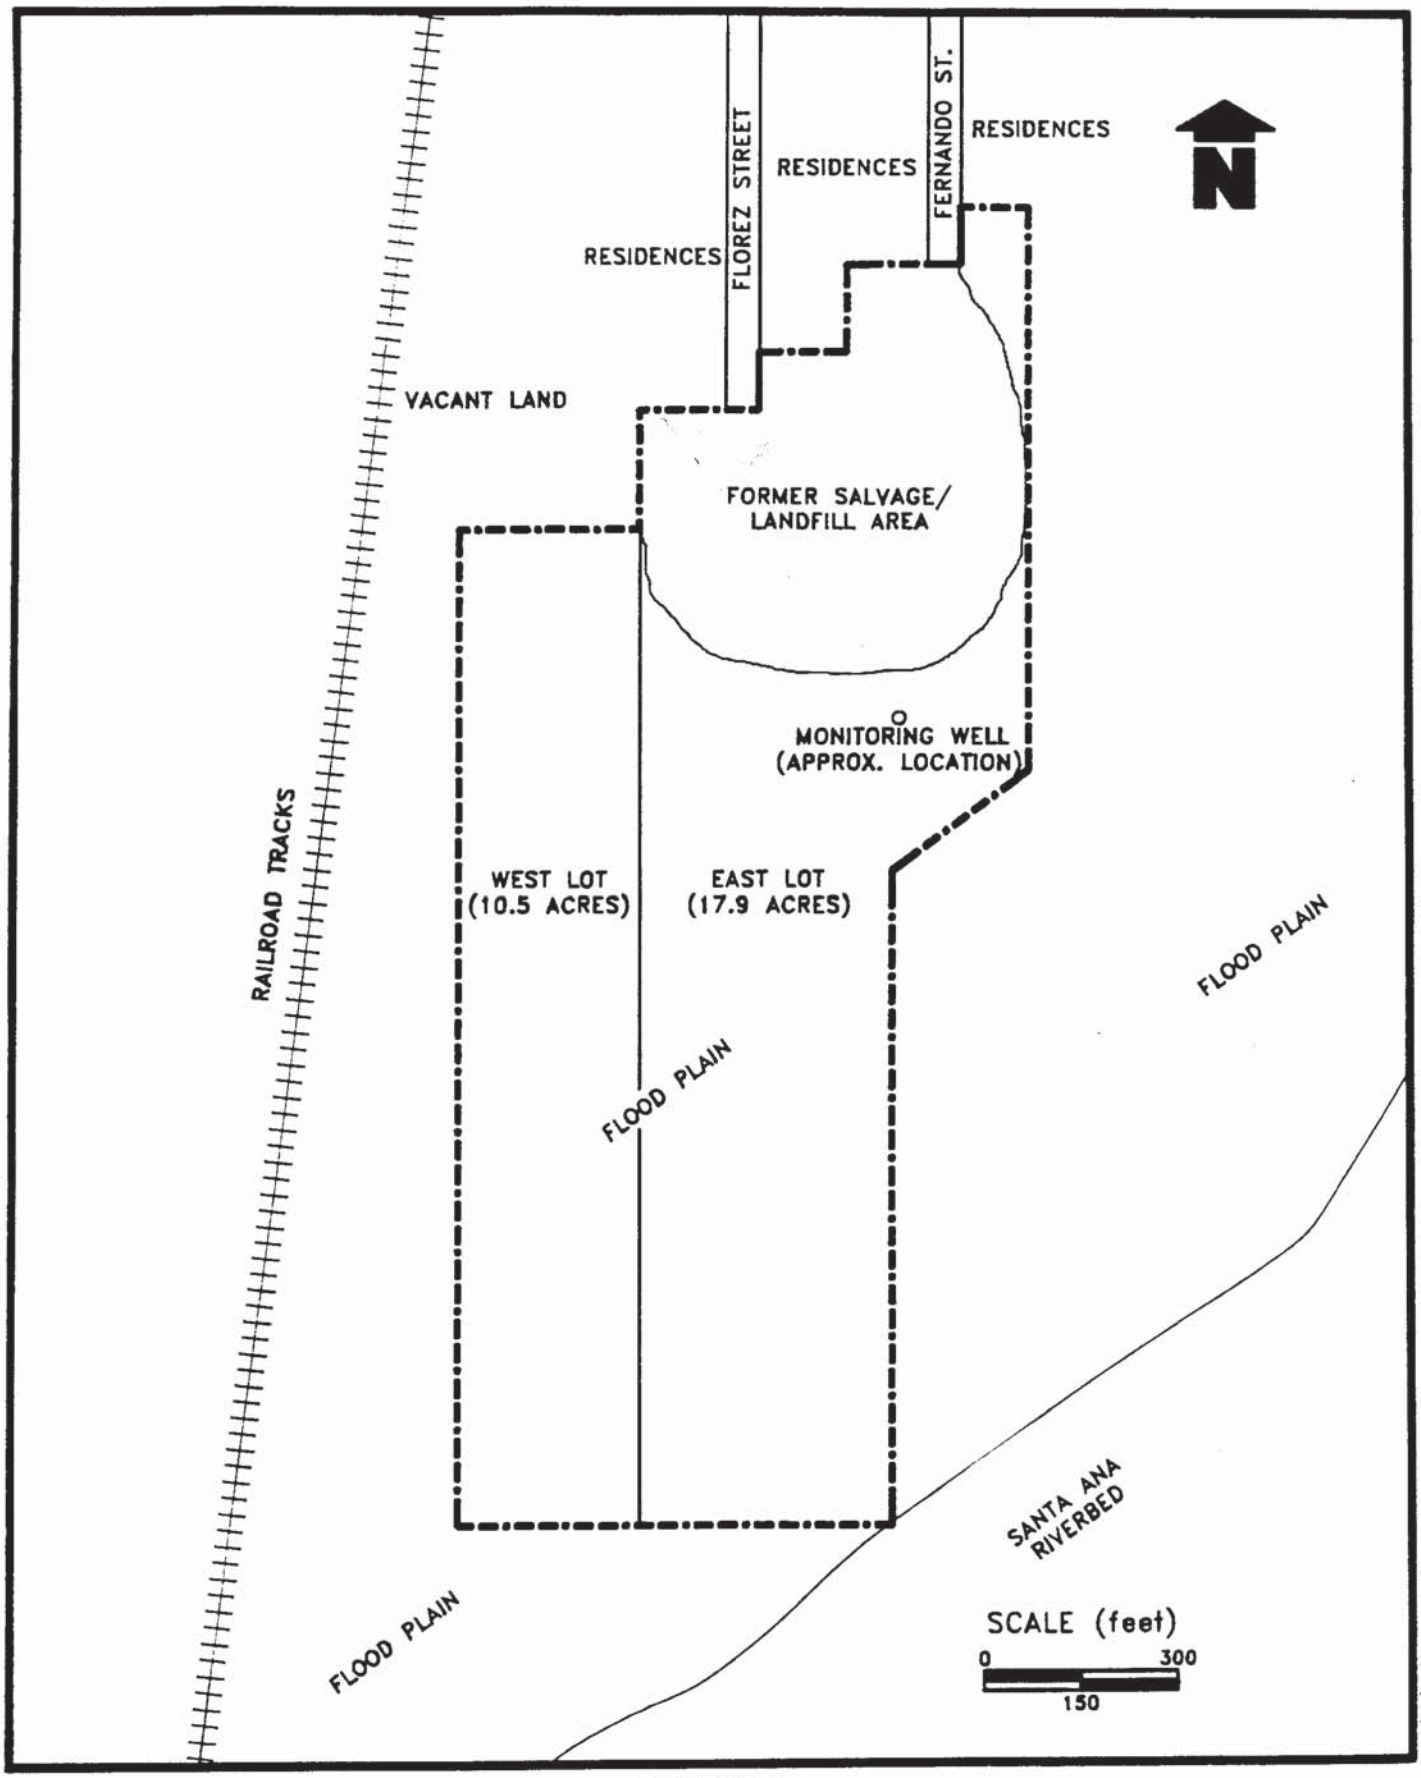
2.2 Site Description

The Guyaux site is located south of the City of Colton along the north bank of the Santa Ana River. The site, as shown in Figure 2, is not developed or paved.[4] The site consists of two adjacent lots which occupy an area of approximately 28 acres. An approximately six acre portion of the eastern lot was operated as a salvage yard for 15 to 20 years.[5]

About one-half of the property consists of an elevated bluff, standing approximately 15 feet above the Santa Ana River bed. The rest of the property is flat and level with the river flood plain. The elevated portion of the property is the repository for various wastes. During the site reconnaissance, wood, concrete, asphalt, bricks, old tires, mattresses, household refuse, furniture, pieces of steel and metal, car and truck frames, empty drums, car fuel tanks, telephone poles, and a crushed fuel tank (approximately 500 gallons) were observed on the property.[4]

The site is bordered on the north by residential areas, on the west by open land, and on the east and south by the Santa Ana River Basin. Access to the site is unrestricted.

2.3 Operational History



In the late 1930's the Guyaux site may have been used to deposit construction debris generated from the rebuilding of the city of Colton after a flood.[4] The owner of the property at that time is unknown. It is also not known if this deposition of wastes was part of levee improvement or merely disposal of wastes.[4]

In the late 1950's, the property was used for the temporary storage of used bricks and other construction materials. Individuals would bring in a load of bricks, clean them up and re-sell them for construction. The waste products generated in this operation were left onsite and used to fill in the site, extending it into the historic flood plain. Other contractors brought such items as steel and wood beams to be sorted and resold. These operations continued until the mid 1980's.[4]

Waste materials were also deposited at the site from the Crane Company.[4] These wastes consisted of plaster molds from the production of bathroom fixtures as well as scrap and broken porcelain.[4,5] The quantity and exact composition of these wastes is unknown. The landfill also received an unknown quantity of waste materials from the Griffin Wheel Company.[4] The composition of this material is unknown. There are several visible piles of this material on the surface of the landfill. It is unknown if any of this material was also buried at the site and there are no records indicating how long these materials were deposited at the site, or in what quantities.[4]

FIGURE 1 GUYAUX LANDFILL SITE
LOCATION MAP

SITE MAP
GUYAUX LANDFILL, COLTON, CALIFORNIA
FIGURE 2

In 1977, the property was purchased by Ralph Guyaux.[4] At that time, the site was still operating as a recycling/disposal yard. Mr. Guyaux continued to receive wastes from the Crane Co. and Griffin Wheel Company for several years until he was directed by the California Regional Water Quality Control Board (RWQCB) to cease those activities in 1981.[5]

In the early 1980's, Mr. Guyaux transported wastes from the Griffin Wheel Company to be sorted for scrap metal.[4] Piles of the waste from Griffin Wheel Company are still located on the Guyaux property. These piles are similar in appearance to a waste pile currently present at Griffin Wheel Dump.[1,4] The wastes at Griffin Wheel Dump are known to contain elevated levels of arsenic, cadmium, chromium, copper, lead, and zinc.[1]

By 1985, authorized (by Mr. Guyaux) waste deposition at the Guyaux site had ceased.[4] Since that time Mr. Guyaux has used the property for the temporary storage of cars and machinery prior to the dismantling.[4] The site is also being utilized by unknown persons as a dump. Materials such as old furniture and used tires are dumped on the property without the approval of Mr. Guyaux.[4]

Aerial photographs dating from 1938 to 1991 on file at the San Bernardino County Department of Transportation and Flood Control were reviewed to determine historic property use and the following observations were made:[6]

1938 - The residential area north of the site has only a few houses with farmland around them. The bank of the river is at the end of Fernando and Florez Streets. The Santa Ana River flows through the north end of property. No apparent dumping or filling onsite.

1955 - Residential area to north has been developed. The Santa Ana River still flows through north end of property, near end of Fernando and Florez Streets. No apparent dumping or filling onsite.

1969 - Salvage area is active, measures approximately 350 feet by 250 feet and appears to be above level of river bed (likely filled in) Santa Ana River has been altered, flowing 1,500 feet south of salvage area rather than at end of Fernando and Florez Streets as in previous photographs.

1978 - Salvage area is active, with vehicles parked onsite. Filled area is larger, approximately 500 feet by 400 feet. No dark waste piles are visible, light colored material visible around outer edge of filled area (possibly Crane Co. wastes).

1986 - Site appears same as today. Salvage area inactive, filled area measures approximately 600 feet by 400 feet. Santa Ana River is approximately 1,500 feet south of filled area. Dark waste piles visible on east and west edges of filled area.

1991 - Site appears the same as in 1986 photograph.

2.4 Regulatory Involvement

This section summarizes the regulatory involvement at the Guyaux site by the Department of Toxic Substances Control (DTSC), The Santa Ana Regional Water Quality Control Board (RWQCB), the County of San Bernardino Department of Environmental Health Services (DEHS), and the City of Colton Planning division.

2.4.1 Department of Toxic Substances Control (DTSC)

The Guyaux site is not listed in the Calsites database and DTSC has no record of the site.[7]

2.4.2 Santa Ana Regional Water Quality Control Board (RWQCB)[5]

In August 1977, RWQCB received a copy of a citizens complaint to the City of Colton regarding the "eyesore" at the Guyaux property. Following receipt of this letter, RWQCB requested that Mr. Guyaux fill out a report of waste discharge (RWD) for the Guyaux site. This request asked for a list of materials deposited at the site, a copy of all permits, and the chemical analysis of the leachate from the waste from Griffin Wheel Company. In January 1978, RWQCB sent out a reminder letter about the RWD. In response to this letter, Mr. Guyaux promised to stop receiving wastes from the Crane Company and advised that no wastes had been received from Griffin Wheel Company in six months. The RWD completed by Mr. Guyaux only declared solid waste deposition at the site. The analysis of samples was not included with the RWD.

In February 1978, RWQCB advised that the RWD was incomplete and that all waste deposition should cease until a permit was issued by the city. In May 1978, the city council in Colton rejected the permit application for Guyaux based upon residential access to the site. The city did not want the large trucks traveling down the residential street to gain access to the site.

In September 1979, RWQCB files indicate that the city of Colton asked Mr. Guyaux to remove the gate at the end of Florez Street because it was blocking access to a city road.

In May 1981, a neighbor complained to the police department that material was being dumped from Griffin Wheel Company on the site. The neighbor complained of dust from an uncovered truck depositing on yards along Florez Street. Following the receipt of this report, RWQCB inspected the property and found ten piles of "black slag" originating from Griffin Wheel Company. Mr. Guyaux reported at that time that the materials were being stored there temporarily and that he would have a sample analyzed.

In December 1981, RWQCB requested the results of the analysis from Mr. Guyaux. Mr. Guyaux reported that the results were either lost or that they had never been done.

Following the December 1981 contact, RWQCB requested a monitoring program in 1985 and a SWAT in 1988. Neither request was answered according to the file at RWQCB and the file has remained open but inactive.

2.4.3 San Bernardino Department of Environmental Health Services (DEHS)

Correspondence in the file at RWQCB mentioned a copy being forwarded to DEHS Solid Waste Division.[5] DEHS did not have any record of the Guyaux site, nor did they have a file.[4]

2.4.4 City of Colton Planning Department (CPD)

The CPD was involved with the Guyaux site throughout the operation. The file on the site was put into warehouse storage[4] and review of that file was beyond the scope of this investigation.

3.0 HAZARD RANKING SYSTEM (HRS) FACTORS

In accordance with the mandates outlined in CERCLA and SARA, the Hazard Ranking System (HRS) was developed to accurately assess the relative degree of risk to human health and the environment posed by a potential hazardous waste site in order to determine the site's eligibility for the National Priorities List (NPL). The HRS addresses four exposure pathways representing means by which hazardous substances may pose a threat to human health and/or the environment. The pathways include three migration pathways (groundwater, surface water, and air) and one exposure pathway (soil). For each pathway, three factors are evaluated: likelihood of release of hazardous substances, targets and waste characteristics.

This section will present a summary of the potential threats associated with each HRS exposure pathways at the Guyaux site.

3.1 Sources of Contamination

There is one potential source of contamination at Guyaux which is an approximately six acre portion of the eastern lot owned by Ralph Guyaux. This portion of the property was used as a salvage yard and unusable materials were used as fill material. The composition of the material that has been used as fill at the Guyaux property is unknown. The landfill operated for approximately 15 to 20 years and the exact composition of wastes received are not known. Reportedly, the majority of the wastes received included bricks, concrete and pieces of steel and wood beams.

As previously discussed, two waste streams, which may contain elevated concentrations of hazardous materials may have been received by Guyaux during the period of operation. There are approximately 10 piles of waste material from Griffin Wheel Company, on the surface of the landfill, totaling approximately 30,000 cubic yards.[4] The exact composition of the material onsite is unknown, but similar material at the Griffin Wheel Dump contains elevated levels of arsenic, cadmium, chromium, copper, lead and zinc.[1] Materials from the Crane Company. including plaster molds and pieces of porcelain scrap were observed throughout the property. The composition and quantity of these materials are unknown. However, an SSI conducted by EPA at the Crane Company documented wastes deposited onsite that were found to contain elevated levels of barium, cobalt, nickel and zinc at their facility.[8] It is not known if the material deposited at Guyaux contains these elements.

3.2 Groundwater Pathway

This section presents information on the hydrogeologic setting, groundwater targets and conclusions regarding the groundwater pathway.

3.2.1 Hydrogeologic Setting[8,9]

The San Bernardino Valley/Upper Santa Ana Valley area is an alluvial plain. It is bounded on the northwest by the San Gabriel Mountains, on the northeast and east by the San Bernardino Mountains, on the southeast by the San Timoteo Badlands, and on the south by the Box Springs and Jurupa Mountains. To the west, the area is bordered by the northern Santa Ana Mountains and the San Gabriel Valley.

The San Bernardino Valley is cut by several near-vertical faults which restrict groundwater movement and creates distinct groundwater sub-basins. Approximately 0.5 miles east of the Guyaux site, the northwest trending San Jacinto fault divides that portion of the valley into the eastern Bunker Hill sub-basin and western Colton-Rialto sub-basin. The San Jacinto fault acts as a barrier to the westward movement of groundwater in the older alluvium, but does not affect groundwater movement in the unfaulted, younger alluvium and river channel deposits. The occurrence of younger alluvium and river channel deposits of the Santa Ana River approximately just south of the site creates a major conduit for groundwater movement through the San Jacinto fault and establishes hydraulic connection between the two sub-basins in that region.

The Guyaux site is located partially within the Santa Ana River floodplain. The stratigraphy beneath the site represents fluvial deposits comprised predominantly of sand and silty sand. The grain size of this deposit increases with increasing depth which is indicative of a point bar structure associated with river deposits. Soil borings at a nearby site indicate that silt and silty sand are found from ground surface to approximately seven feet below ground surface. Beneath this, a layer of silty sand (7 to 12 feet) overlies a predominantly sand layer (12 to >20 feet).

The proximity of the Santa Ana River to the Guyaux site influences the historical groundwater level. During periods of high water flow through the river channel, the groundwater level rises. The opposite is true during periods when the flow in the river channel is low. This fluctuation in groundwater levels could cause variations in groundwater flow direction.

Groundwater wells at nearby sites are drilled to a depth of 45 feet and these wells are reported to be dry since the Landers earthquake in the summer of 1992.

3.2.2 Groundwater Targets

The City of Colton and the surrounding areas receive 100% of their water from local groundwater sources.[1] The nearest drinking water well, operated by the City if Colton, is located to the south just over one mile from the Guyaux site.[10] This well is currently closed due to the presence of PCE, TCE, and toluene in the water.[1] The Riverside Highlands Water Company currently operates three other wells which are located within two miles of the site.[1] These wells serve approximately 10,000 people.[10] The City of Colton operates a system of 13 wells servicing 29,000 people and the City of Riverside operates a system of 42 wells serving

208,000 people.[10] The City of San Bernardino also operates a system of 45 wells serving approximately 110,000 people and the West San Bernardino CWD operates a system of 27 wells serving approximately 40,000 people.[10] In total, approximately 397,000 people are served by groundwater within four miles of the Guyaux site.[10]

3.2.3 Groundwater Conclusions

An observed release, as defined by the HRS, is when the chemical analysis of an environmental sample from a site is found to be three or more times above the background concentration and some portion of the release is attributable to the site. There is, however, no groundwater sampling data available for this site.

As a result of the limited information available during this investigation, the groundwater pathway was evaluated based upon a potential for release of arsenic, cadmium, chromium, copper, lead, and zinc (suspected constituents of Griffin Wheel Dump waste). The population served by groundwater within the four mile target distance limit is approximately 397,000.

3.3 Surface Water Pathway

This section presents information on the hydrologic setting and surface water targets and provides conclusions for the surface water pathway.

3.3.1 Hydrologic Setting

The Santa Ana River bed is located about 1,500 feet south of the landfill area.[2,4] The Guyaux property extends almost to the river bank, but the portion of the property closest to the river does not appear to have been used as a landfill.[4]

The river flows in a southeasterly direction and while continuously flowing throughout the year, there is very minimal flow in the summer months.[1]

Drainage from the landfill area would flow off of the elevated portion of the property into a dry "flood channel" located along the south end of the property. This channel is unlined and remains dry except in periods of heavy rainfall.[4] The channel joins the Santa Ana river approximately one-half mile from the landfill.[2,4] Drainage from the waste pile areas is uncontrolled and would flow south into the "flood channel".[2]

The 2-year, 24-hour rainfall in the vicinity of Colton is 2.5 inches.[8] A flood plain designation for the southern end of the property was not available, however, the northern or elevated portion of the site is considered to be outside of the 500-year flood plain.[11]

3.3.2 Surface Water Targets

There are no drinking water intakes located within 15 downstream miles of the site.[8] Residents in the area receive all of their water from municipal groundwater wells.

The Santa Ana River riparian environment, located approximately two miles downstream of the site, includes the habitats of several threatened and endangered species.[12] These species include: Gambel's Watercress (threatened Category 1), Los Angeles Pocket Mouse (Category 2), Santa Ana Wollystar (endangered) and Least Bells Vireo (endangered).[12]

There are parks and recreational areas within one-quarter mile of the Santa Ana River. There are foot trails leading to the river, but recreational use of its waters is not encouraged.[1]

3.3.3 Surface Water Pathway Conclusions

The surface water pathway was evaluated based upon the potential to release hazardous substances from the landfill to the Santa Ana River. The potential for release to surface water increases in the event of heavy rain or flooding due to the close proximity of the waste piles to the "flood channel" and the uncontrolled run-off from the site.

3.4 Soil Exposure and Air Pathways

This section presents information on the physical conditions at the site, soil and air targets, and provides conclusions for the soil exposure and air pathways.

3.4.1 Physical Conditions

The Guyaux site is unpaved with a gravel road providing access to the property.[4] There is no fence at the end of Florez or Fernando Streets to limit access to the property.[4] During the site reconnaissance interview, Mr. Guyaux reported that several people have been observed dumping materials on the property. A dirt trail used for dirt bikes was observed on the west end of the property.[4]

Access to the waste materials from Griffin Wheel Company and the Crane Company is unrestricted and the materials are not covered.[4]

3.4.2 Soil and Air Targets

There are no workers on the Guyaux property. The nearest residence to the site is within one-quarter mile to the north on both Florez and Fernando Streets.[4] The total population within a four-mile radius of the site is approximately 47,268.[13]

3.4.3 Soil Exposure and Air Pathway Conclusions

There is a potential for exposure to the waste piles at the Guyaux site because the site is not fenced and access to the site is unrestricted. The site is accessible by motor vehicle or on foot. The site also appears to be used for some recreational activities.

There is also a potential for a release to air at the Guyaux site. The soil piles from Griffin Wheel Company are not covered and the material is composed of ash and very fine grained materials. However, during the site reconnaissance visit, no visible emissions were observed.[4]

4.0 EMERGENCY RESPONSE CONSIDERATIONS

The National Contingency Plan [40 CFR 300.15(b)(2)] authorized EPA to consider emergency response actions at those sites which pose an imminent threat to human health and the environment. Emergency response actions are not considered necessary for the Guyaux site at this time.

5.0 SUMMARY

The Guyaux Landfill received an unknown quantity of wastes from the late 1950's until the mid 1980's. Solid wastes from the Griffin Wheel Company were deposited on the 17.9 acre section of the property. These soils are suspected to contain high levels of metals including arsenic, lead, chromium, cadmium, copper, and zinc. There is no direct evidence that the waste piles have released metals into the environment. There is, however, a potential for a release to all of the pathways.

The waste materials from the Crane Company. were observed throughout the landfill. The quantity and composition of these materials is unknown. For the purposes of this investigation, these wastes were not evaluated since the contaminants from Griffin Wheel Company were perceived to be more hazardous to human health and the environment.

Currently, RWQCB has an open file on the site but the agency is not currently planning any course of action.

The pertinent HRS factor for the Guyaux site is as follows:

- There are approximately ten waste piles at the Guyaux site from Griffin Wheel Company. Similar material located at Griffin Wheel Dump have exceeded the California total threshold limit concentration (TTLC) for lead. The subsequent waste extraction test showed that the materials have also exceeded the soluble threshold limit concentration (STLC) for lead of 5 ppm. The wastes received from Griffin Wheel Company may also contain elevated levels of chromium, cadmium, copper, and zinc. This soil is a potential source of contamination for the groundwater, surface water, soil exposure, and air pathways.

- The Guyaux site is located in the San Bernardino Basin, which utilizes only groundwater for their water supply. Wells within four miles of the site operate on a blended system and serve over 397,000 people.

6.0 EPA RECOMMENDATION

	INITIAL	DATE
Site Evaluation Accomplished (SEA)		
High priority SSI	cjd	6/10/93
Low priority SSI		
Deferred to other Authority (e.g. RCRA, TSCA, NRC)		

Notes:

REMEDIAL SITE ASSESSMENT DECISION - EPA REGION 9

Site Name: Guyuso Landfill EPA ID#: CAD983652053

Alias Site Names:

City: Colton County or Parish: San Bernadino State: CA

Refer to Report Dated: 6/9/93 Report type: PA

Report developed by: Roy F. Weston

DECISION:

| | 1. Further Remedial Site Assessment under CERCLA (Superfund) is not required because:

| | 1a. Site does not qualify for further remedial site assessment under CERCLA (Site Evaluation Accomplished - SEA)

| | 1b. Site may qualify for further action, but is deferred to: | | RCRA | | NRC

|X| 2. Further Assessment Needed Under CERCLA: 2a. (optional) Priority: |X| Higher | | Lower

2b. Activity Type: | | PA | | ESI |X| SI | | HRS evaluation | | Other:

DISCUSSION/RATIONALE:

Waste at the site has a high potential to impact the media pathways and the soil exposure pathway. Approximately 100,000 people uses groundwater within a 4 mile radius of the site.

Site Decision Made by: Signature: Carolyn J. Douglas Date: 6/10/93

EPA Form # 9100-3

Instructions: Use of EPA Form #9100-3

1) **Filling blanks and boxes using a wordperfect version of the form:** This is most easily done in the 'typeover' (or insert) mode in wordperfect. Begin by hitting the 'insert' key on your keyboard, move to the line or box desired, and begin typing. The boxes are set up to give bold characters, and the line characters ("_") ensure the form keeps a constant format. The form uses wordperfect version 5.1 and a 'universal scalable' font; you may need to revise printer setup to accommodate this. The diskette provided contains 2 versions of this form in Wordperfect 5.1 format (see point 2 below). These files have a write protection code.

2) **Discussion/Rationale Section:** The evaluator should enter comments as appropriate. To facilitate this, two versions of this form are provided in wordperfect files. Version "SA-DECIS.#1" contains the version found on the front side of this form. You can complete this form in writing or by using the 'typeover' mode when entering discussion text using wordperfect. Version "SA-DECIS.#2" has the exact same form, except the lines have been deleted from the discussion box. This box was created using 'Tables' in wordperfect 5.1, thus it can expand as new lines are added or scrolled within the box. The evaluator can simply enter text in the normal edit mode in wordperfect.

3) **Use of 'not applicable - (n/a)':** This can be entered wherever appropriate. For example, in cases where EPA wants to re-evaluate a previous decision based on new information and no report applies, the evaluator may enter 'N/A' for "report type" and "report date". The Discussion/Rationale section should explain what new information supports EPA's decision.

4) **Signature Boxes:** When using this form to document report approval, the Regionally designated person responsible to review and approve a final report should sign and date the "Report Reviewed and Approved by" line. Otherwise, reviewers can choose to sign their approval directly on a report and eliminate the "Report Reviewed and Approved by" signature box from this form.

The person responsible for deciding what, if any, further site assessment is required should complete the 'Site Decision Made by' line (note that this can be the same person who reviewed and approved a report). All dates should reflect when an actual review or decision is complete. Only site decision dates, and not site assessment report dates, need to roughly correspond to CERCLIS entry dates.

Explanation of Entries

1) Site Name = same name as listed in CERCLIS
2) EPA ID = same as CERCLIS ID number
3) Alias site names = self explanatory
4) City, County or Parish, State = same as listed in CERCLIS
5) Report date = if applicable, date of final report associated with the site decision
6) SEA = Site Assessment Accomplished, the successor of No Further Remedial Action Planned (NFRAP)
7) RCRA = the Resource Conservation and Recovery Act (RCRA) program of EPA
8) NRC = the Nuclear Regulatory Commission
9) PA = Preliminary Assessment
10) SI = Site Inspection
11) SIP = Site Inspection Prioritization
12) ESI = Expanded Site Inspection
13) Regional Decision Team - a group of EPA Regional managers who evaluate the need for site assessment and response action at a site and formulate appropriate steps to address those needs.

APPENDIX A

Contact Reports

SITE RECONNAISSANCE INTERVIEW AND OBSERVATION REPORT

REPORT BY: ROY F. WESTON, INC.

OBSERVATIONS MADE BY: Carol Hays
Brian Oatman

DATE: 02-04-93

FACILITY REPRESENTATIVE(S): Ralph Guyaux-Property Owner

SITE NAME: Guyaux Landfill
End of Florez and Fernando Streets
Colton, CA 92324

Information provided during interview:

Mr. Guyaux bought the property in 1977 from Mr. R. Zandbergen. The property was being used as a salvage/disposal yard. Contractors would bring in construction wastes such as bricks and steel and wood beams. They would clean them up, sort them and resell the usable materials. Wastes generated from this process would be left on site as part of the fill. These activities continued until the mid 1980's.

Wastes were brought to the site from the Crane Company and from Griffin Wheel Company. Mr. Guyaux reported that when he purchased the site there was an existing agreement with the Crane Company to receive their waste plaster molds and broken and scrap porcelain. Mr. Guyaux did not know the quantities of they waste received and there were no written records.

Mr. Guyaux reported that the wastes received from Griffin Wheel Company had been brought over by him so that he could salvage scrap metal from the waste. He said that it had only been a few loads and that none of the waste had been used as "fill." Mr. Guyaux reported that the only wastes from Griffin on the site were the visible piles on the surface of the landfill.

Mr. Guyaux reported that he believed that the site had been used in the late 1930's as a repository for construction wastes when the City of Colton was rebuilt after the flood in 1938. He did not know exactly what the wastes consisted of.

When asked about the RWQCB file information regarding analysis of the Griffin Wheel Company waste material he said that he had never had a sample taken since they wouldn't issue him a permit to operate the landfill. He stated that he stopped taking wastes from everyone after directed by the RWQCB to do so in 1981.

Observations made during the site reconnaissance:

A gravel road extends out from Florez Street in a circle. At the southern end of the circle the Guyaux property begins. From this point visible debris was observed. There were piles of

black material from Griffin around the perimeter of the bluff. There were piles of old tires, furniture, wood, concrete, asphalt, bricks, mattresses, household refuse, a crushed tank (approximately 500 gallons), pieces of steel/metal, car and truck frames, empty drums, stucco, car fuel tanks, rocks, telephone poles, pieces of porcelain and plaster molds, and graphite electrodes from the Griffin Wheel Company furnace.

The Griffin Wheel Company wastes were measured by pacing off the perimeter and estimating the height. The west area of Griffin Wheel Company piles measured 50 x 20 paces (a pace = 2.3 feet). The east area of Griffin Wheel Company waste measured 40 x 15 paces. The waste piles were approximately four feet high.

Small areas of oil staining were observed near the road.

Below the bluff along the southern and eastern and western edges, large amounts of plaster molds, porcelain chunks, and roofing materials were observed. Just below the waste piles a small dry river bed was observed. Mr. Guyaux reported that this became a drainage channel when there were heavy rains.

On the west side of the bluff a dirt bike trail was observed. No recreational activities were observed at the time of this reconnaissance.

Discussion:

Guyaux Landfill, located at the end of Florez and Fernando Streets in Colton, California, is located in two different flood plains.

The southern portion of the site nearer to the river is in Zone AE. The description for that zone is "Base Flood Elevations are determined." Elevation is listed as 922 feet.

The northerly portion of the property is in Zone X. The definition for that zone is "area is determined to be outside the 500 year flood plain."

INTRODUCTION

This technical memorandum summarizes the hydrogeological investigations and findings of the area known as Site 2. Site 2 has been abandoned as a potential Rapid Infiltration/Extraction (RIX) facility because of a number of concerns identified during the conduct of the hydrogeological investigations. One of the more significant concerns is the presence of groundwater contamination by tetrachloroethane (also called perchloroethene, PCE). The Santa Ana Watershed Project Authority (SAWPA), its member agencies, and other state or local agencies may initiate activities to address this contamination. The information in this technical memorandum will provide a starting point for those activities.

BACKGROUND

Site 2 is an approximately 110-acre parcel located adjacent to the Santa Ana River in Colton, California. As seen in Figure 2B-1, the site is located east of La Cadena Avenue and on the northwest side of the river. The demonstration site is an approximately 10-acre portion of the larger Site 2 area. The larger area will be referred to as Site 2, and the smaller area will be referred to as the Demo Site herein as shown on Figure 2B-2.

Previous work indicated that Site 2 is favorable for the RIX process. The previous work consisted of a hydrogeological investigation by Schaefer Dixon Associates in conjunction with Metcalf and Eddy (M&E, 1988). Their investigation included cone penetrometer tests (CPT), soil borings, well installation, aquifer testing, and infiltration tests. Data were collected over Site 2, but limited work was done on the Demo Site. The previous work also included a two-dimensional groundwater flow model of RIX at Site 2. Groundwater quality data were not collected during the previous work.

Rix project takes 2ndary effluent east of ~~site~~ from San Bardo treatment plant, runs along river, south of Guyaux, thru hole near plexco, ~~xxxx~~ under La Cadena, to Colton plant, receives more effluent, finally discharges to percolation ponds west of Colton facility

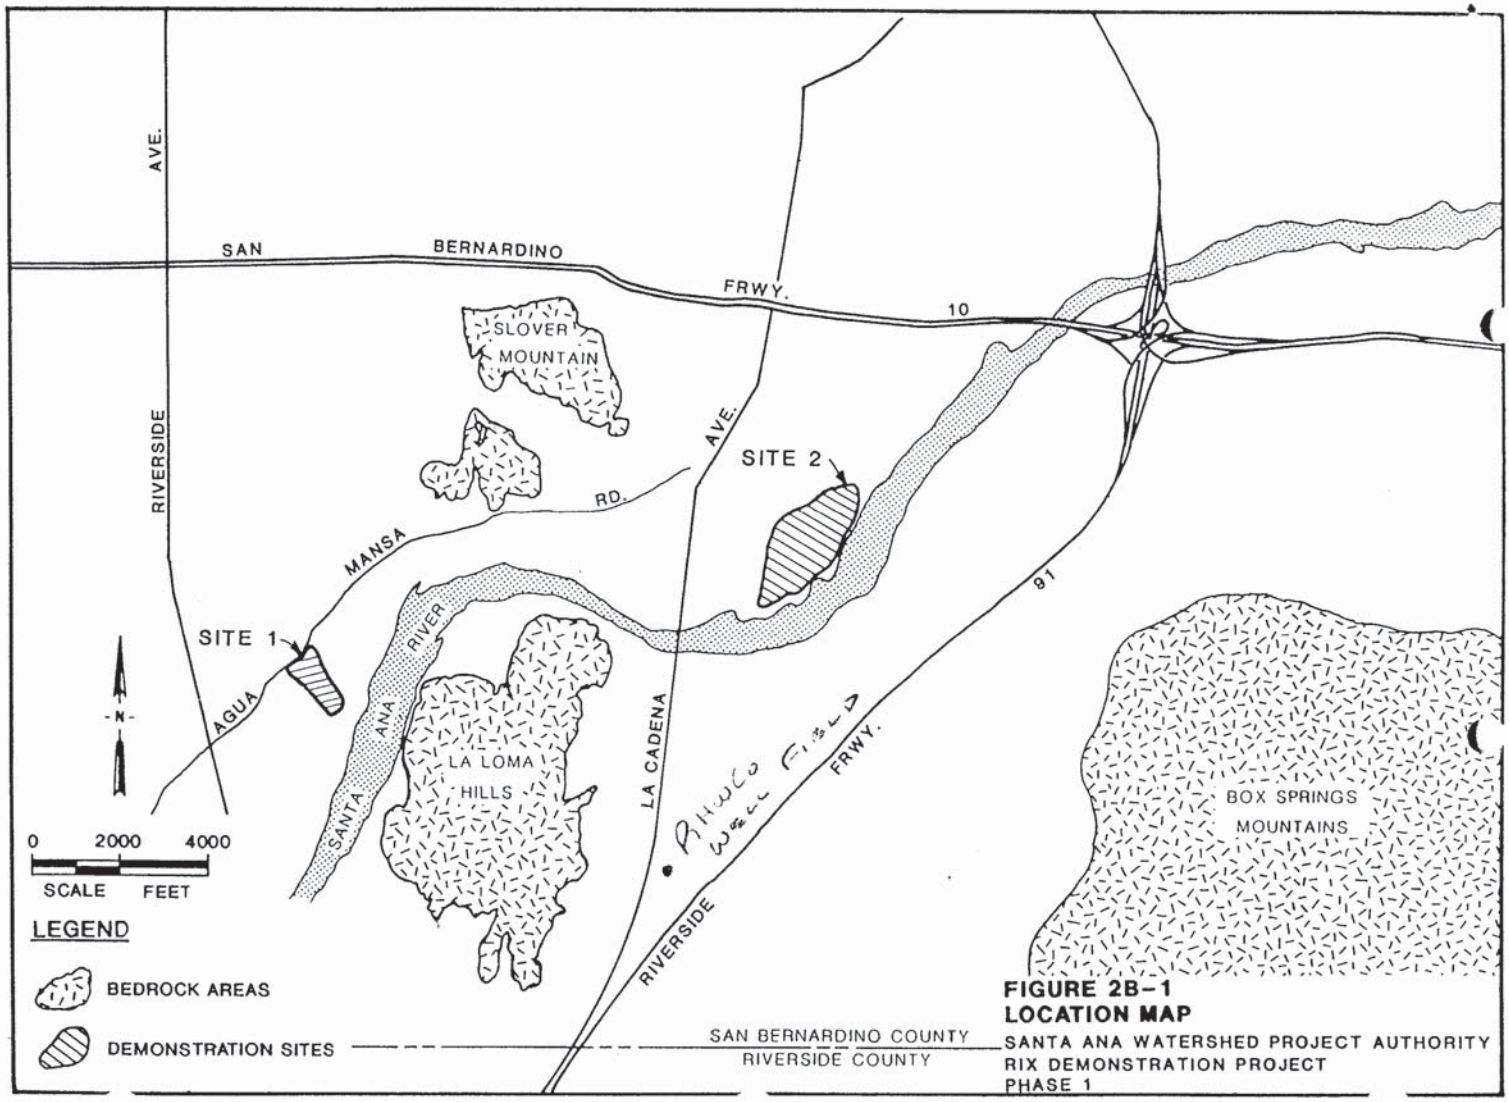

FIGURE 2B-1

RIX DEMONSTRATION PROJECT
PHASE 1

CH2M HILL conducted additional hydrogeological investigations of the Demo Site to obtain data for design purposes. Several issues developed during the hydrogeologic investigation of the Demo Site that resulted in an expansion of the scope of work. These issues are:

1. The availability of the 44-acre Riverside property located adjacent to the Demo Site. This property is required to implement the full-scale RIX facility if all the City of San Bernardino Wastewater Treatment Plant secondary effluent is treated at Site 1 (ultimate flow projected at 43 million gallons per day [mgd]).

2. The nature of a dump site on the west side of the Demo Site but contained within the boundary of Site 2.

3. The presence of a zone of fine-grained sediments with unfavorable water transmitting properties located in the subsurface of the Demo Site.

4. The occurrence of volatile organic compounds (VOCs) in monitoring wells installed at Site 2.

SAWPA authorized a second phase of work to further address these issues.

PURPOSE

The purpose of the hydrogeological investigation is twofold:

1. To provide the hydrogeological information necessary to design the extraction and monitoring systems for the RIX demonstration project.

2. To establish background groundwater quality conditions.

SCOPE

Two phases of work were completed at the Demo Site because of the potentially unfavorable hydrogeologic conditions indicated by the first phase. The first phase of work was conducted on the Demo Site only. The second phase included work outside the Demo Site.

Phase 1 work consisted of the following:

1. Review background information on the regional and local hydrogeology. Information reviewed included previous consultants' work, drillers' well logs, and publications describing the regional hydrogeology.

2. Drill two borings and describe the sediments encountered during the borings; install a monitoring well in each of these borings.

3. Drill a pilot hole to 105 feet and describe sediments encountered during drilling; install one 8-inch-diameter extraction well at the same location.

4. Measure groundwater levels to estimate the hydraulic gradient to assess the direction and rate of groundwater movement.

5. Conduct a long-term aquifer test to estimate the water storage and transmitting properties of the alluvial sediments.

6. Collect samples from the monitoring wells to establish background groundwater quality. Samples are collected on a quarterly basis prior to the operation of the demonstration project.

7. Evaluate field data to describe the hydrogeology and groundwater quality.

8. Develop a groundwater model of the site to assist in the design of the extraction system and monitoring system for the RIX demonstration project.

9. Conduct a geochemical evaluation to assess potential fatal flaws with respect to the geochemical processes.

10. Prepare a technical memorandum describing the results of the work.

Based on the findings of the Phase 1 work, CH2M HILL recommended additional soil borings, aquifer testing, and water quality sampling prior to proceeding with items 8 and 9 above. Phase 2 work consisted of the following:

1. Three additional borings on the Demo Site

2. One aquifer test on the Demo Site

3. Four additional borings on the remainder of Site 2

4. Two aquifer tests on the remainder of Site 2

5. One groundwater sample downgradient of a dump site

6. Evaluation of Phase 2 data and preparation of a technical memorandum on findings and recommendations

RIX DEMONSTRATION PROJECT PHASE 1

Based on the findings of the hydrogeology investigation as summarized in a November 3, 1989, memorandum, items 8 and 9 of Phase 1 will not be completed.

HYDROGEOLOGY

This section describes the hydrogeology of the site. The regional setting is described, followed by a discussion of the site hydrogeology. The discussion of the site hydrogeology includes a description of the site physiography and land use, subsurface stratigraphy, hydrogeologic properties, groundwater flow conditions, and groundwater quality.

REGIONAL SETTING

The site is located in the Riverside North groundwater basin. This basin is filled with alluvial sediments that extend up to 800 feet below the ground surface, where bedrock is encountered. The alluvial sediments consist of recent sediments deposited by the Santa Ana River and its tributaries and older alluvium. The basin is bounded by bedrock areas to the south (the Box Springs Mountains) and to the southwest (the La Loma Hills) as shown in Figure 2B-1. Bedrock areas also occur within the basin to the west of the site (Slover Mountain). Generally, bedrock consists of crystalline rocks that yield small amounts of water to wells (in the range of 1 to 10 gallons per minute [gpm]) compared to the alluvial sediments that yield larger amounts of water to wells (in the range of 100 to 1,000 gpm or more).

The depth to groundwater in the alluvial sediments varies from several hundred feet to a few tens of feet below the ground surface. The shallowest depths to groundwater generally occur near the Santa Ana River. Production wells produce from 100 to 400 feet below the ground surface with specific capacities of 18 to 104 gpm per foot of drawdown (gpm/ft) (James M. Montgomery, 1987).

SITE HYDROGEOLOGY

This section discusses the site hydrogeology. The site physiography and land use are described first, followed by discussions of the subsurface stratigraphy, hydrogeologic properties, groundwater flow conditions, and groundwater quality.

SITE PHYSIOGRAPHY AND LAND USE

Site 2 is in the Santa Ana River floodplain on the northwest side of the river. The land surface is generally flat except for small ephemeral washes that traverse the site. The slope of the land surface is about 0.003 foot/foot (15 feet per mile) to the

southwest. Over most of the site, the topsoil is sand and silty sand; and vegetation is scrub brush with only a few trees. Residential areas exist on the northern edge of the site along with light industry such as construction yards, wrecking yards, and a dry cleaner. A dump is on the northern edge of the site adjacent to the demonstration area as shown in Figure 2B-2. Debris at the dump includes old vehicles, piles of a slag-type material, and construction debris.

STRATIGRAPHY

Previous work on the site included borings and cone penetrometer tests (Metcalf and Eddy, 1988). Indirect information about subsurface conditions is supplied by the CPT data because sediment types are inferred from the tests and sediment samples are not recovered. Data from the previous CPT investigation generally does not extend below 25 feet because the cone penetrometer cannot penetrate cobble zones. The locations of borings, wells, and CPT data from the previous work and this hydrogeological investigation are compiled in Figure 2B-2. The field procedures followed during drilling and other field activities are discussed in Appendix A. Geologic logs of the borings drilled in this work are in Appendix B. Locations of geologic cross sections and generalized sediment types are shown in Figure 2B-2.

Figure 2B-3 is a cross section approximately parallel to the river along the northern edge of the site. Figures 2B-4 and 2B-5 contain three cross sections illustrating subsurface conditions at various locations. These cross sections indicate the following:

1. A fine-grained zone consisting of silt and clay is encountered at about 35 feet below ground surface on the Demo Site.

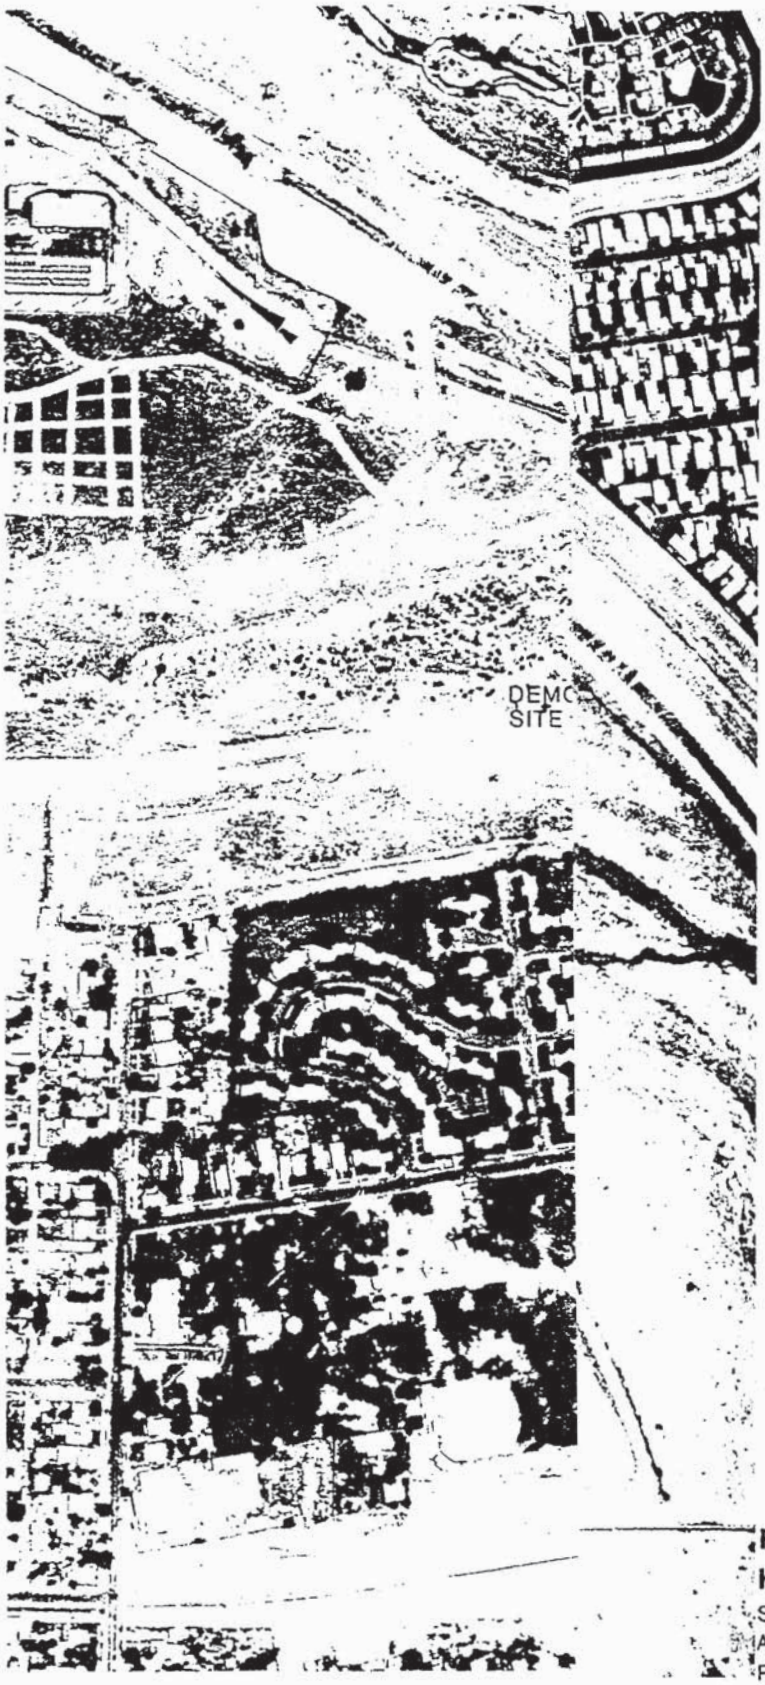
2. The zone of fine-grained sediments is estimated to extend to the east as shown in Figure 2B-2.

3. Medium to coarse sand occurs throughout the area outside the fine-grained zone except for thin silt and clay layers and cobble zones. Cobble zones are mostly 1 to 4 feet thick and are most prevalent closer to the Santa Ana River.

HYDROGEOLOGIC PROPERTIES

Aquifer tests were performed to estimate the water storage and transmitting properties of the subsurface sediments. These tests were conducted at wells EW-1, MW-4B, MW-5, A-1, A-2, and A-3 and consisted of pumping groundwater from each well and measuring

The estimated transmissivity, hydraulic conductivity, and storage coefficient values are summarized in Figure 2B-10. The hydrogeologic test data indicate the following:



1. The zone of fine-grained sediments encountered on the Demo Site at a depth of about 30 feet have a low K_h value, which is several orders of magnitude lower than the surrounding sediments. This zone is expected to significantly retard the vertical movement of groundwater.

2. Tests were not conducted in the unsaturated zone above the zone of fine-grained sediments. However, based on the nature of the sediments as observed from the borings and the infiltration tests, the K_h of this zone is anticipated to be similar to the K_h of the more permeable sediments (e.g. similar to P-1 and P-2).

3. Outside the area underlain by the fine-grained sediments, the K_h is high, and probably ranges from 100 to 400 ft/day in the sandy sediments. The K_h of the cobble zones may be as high as 1,000 ft/day.

GROUNDWATER FLOW CONDITIONS

Groundwater level measurements have been collected in all the wells shown in Figure 2B-2. These data are used along with the estimated hydraulic conductivity values to estimate the direction and rate of groundwater movement. Figure 2B-10 shows the groundwater elevation at four of the monitoring wells and the direction of groundwater flow based on the monitoring wells. The hydraulic gradient is approximately 0.003 to the southwest. Based on the estimated hydraulic conductivity for the sandy, coarse sediments to the east of the area containing the fine-grained sediments, the rate of groundwater movement ranges from about 1.5 to 6 ft/day, assuming an effective porosity of 0.2. Data are not available on the vertical gradient. However, the vertical movement of groundwater is anticipated to be much less than the horizontal movement because of the occurrence of the low hydraulic conductivity silt and clay layers as seen in Figures 2B-3 through 2B-5.

RECOMMENDATIONS

Based on the findings in this investigation, it is recommended that:

1. Site 2 be abandoned as a RIX facility

2. The contamination problem should be referred to the Regional Water Quality Control Board for further action

FIELD PROCEDURES

APPENDIX 2B-A
FIELD PROCEDURES

INTRODUCTION

This appendix describes the procedures followed during field activities. These activities consisted of drilling borings, installing and developing monitoring wells, drilling and installing an extraction well, developing an extraction well, testing aquifers, and sampling groundwater from monitoring wells.

BORINGS WITH HOLLOW STEM AUGERS

Borings were drilled with 4-inch, hollow-stem augers. Samples were taken every 5 feet with a 18-inch-long split-spoon sampler. When the sampler was driven into the formation, the blow count was recorded in 6-inch intervals. During boring B-1, a 5-foot-long continuous sampler was initially used to attempt to sample more of the formation. However, recovery in the continuous sampler was less than 1 foot in most intervals because of bridging by cobbles in the sampler. Therefore, the continuous sampler was used only in the upper 20 feet of boring B-1. In some intervals of the borings, a 5-foot-long split-spoon sampler was driven into the formation to attempt to sample more of the formation. Samples were logged in the field, and samples were collected in plastic bags every 5 feet or at a change in lithology. Representative samples for grain-size analysis and geochemical analysis were selected after the Phase 1 borings were completed.

Samples collected from the borings were logged based on the following characteristics:

- Sediment type (e.g., clay, silt, sand) was noted by determining the relative amount of each grain size. Each sample was classified based on the most prevalent grain size. For example, if a sample contained 50 percent sand, 35 percent clay, and 15 percent silt, the sample would be referred to as a sand. If a grain size occurs as greater than 15 percent of the sample, such as silt in the above example, this grain size is included in the description of the sample. If a grain size occurs as less than or equal to 15 percent of the sample, this grain size is included in the description of the sample with the adjective "slightly." In the above example, the sample would be classified as: sand, with clay, slightly silty. The maximum size of the gravel is recorded in inches, and the amount of gravel is recorded by percent.

- The mineralogy of the sand and gravel fraction of each sample was recorded.

- The consistency of the sample was noted by determining whether the sample was loose, slightly consolidated, or consolidated.

- The moisture content of the sample was noted by determining if the sample was dry, slightly damp, damp, or wet.

- The color of each sample was also recorded.

The drill rig bounced and chattered when cobble zones were encountered during drilling. The presence of these zones was noted on the boring logs. Each boring was drilled to 75 feet if possible. However, the presence of cobble zones at about 65 feet over much of the site prevented drilling to 75 feet at some of the borings. Large cobbles were encountered at 40 to 45 feet in boring MW-4, which the drill rig could not drill through; and the boring was abandoned. A second boring approximately 10 feet away encountered a similar obstruction at 47 to 48 feet and was also abandoned. At boring B-3, large cobbles were encountered at 17 feet, which the drill rig could not drill through. A second boring about 10 feet away was drilled to 21 feet but could not drill through a cobble zone at 21 to 22 feet and was abandoned. The depth of each boring is shown in Table 2B-1 of this memorandum. Borings where monitoring wells were not installed were backfilled with grout.

After completion of drilling at one hole, drilling equipment was steam-cleaned before moving to the next hole.

INSTALLATION OF MONITORING WELLS

Two monitoring wells were installed during the Phase 1 field activities at Site 2 and three temporary monitoring wells were installed during Phase 2 activities. The discussion below describes the installation of the two monitoring wells installed during the Phase 1 activities. After drilling and sampling with 4-inch augers, the borings were reamed out with 8-inch augers prior to installing the monitoring wells. Monitoring wells were constructed with 4-inch Schedule 40 polyvinyl chloride (PVC) casing with threaded fittings and 4-inch Schedule 40 PVC slotted well screen, with 0.020-inch slot size. The well screen generally extended from the water table to 20 feet below the water table. Five feet of blank PVC casing were installed below the well screen to serve as a sediment trap. Sand filter pack consisting of Monterey No. 3 sand extended from the bottom of the sediment trap to at least 5 feet above the top of the well screen. A 2-foot-thick bentonite clay seal was placed on top of

the sand pack. The annulus was filled with cement grout, which consisted of 5 percent bentonite and 95 percent type II Portland cement, from the top of the bentonite seal to the ground surface. The depth of each well and screened interval are shown in Table 2B-1.

The wellhead consisted of an approximately 6-inch-thick concrete pad with a steel riser pipe with locking cap over the top of the casing. Three grout-filled steel pipes were placed in the ground around each monitoring well. The construction of the temporary monitoring wells during the Phase 2 activities was similar to the two monitoring wells installed during the Phase 1 activities, except that a bentonite seal and cement grout were not installed; and the casing and well screen were removed from the boring after the tests performed with the temporary wells were completed. The boreholes were grouted after the temporary wells were removed.

DEVELOPMENT OF MONITORING WELLS

Development of the monitoring wells consisted of surging with a surge block, bailing, and pumping and surging with a submersible pump. After the well screen and casing were installed, the well was initially developed by surging the well with a surge block to draw the fine sediments around the well annulus into the well. The surge block was lowered to the bottom of the well and rapidly removed about 10 times to surge the well. A bailer was then lowered into the well, and the sediment in the well was bailed out. The amount of sediment in each well was variable, but the sediment in the wells was removed after about 10 bails on average. After bailing the sediment, the well was surged again with the surge block and the sediment removed with the bailer. The amount of sediment drawn into the well during the second period of surging was generally small. After the sediment was bailed, a submersible pump was lowered into the well; and the well was surged by turning the pump on and off. The well was surged in this manner until the discharge was relatively clear of silt and clay. The period of time each well was pumped generally averaged 2 hours.

DRILLING OF EXTRACTION WELL

The extraction well (EW-1) was drilled with a mud-rotary drill rig. A 14-inch-diameter steel conductor casing was set from the ground surface to 18 feet below the ground surface. The conductor casing was set by drilling to 18 feet with air circulation to remove the cuttings and pressure grouting the casing with cement grout. A 12-inch-diameter pilot hole was drilled to 105 feet with mud circulation to remove the cuttings. Samples were taken every 5 feet by filling a bucket with drilling mud as the mud flowed out of the pilot hole. Samples were logged in the

field and were collected in plastic bags. Samples were logged based on sediment type, color, and mineralogy as discussed above for the hollow-stem auger borings. During mud rotary drilling, samples are disaggregated; and the presence of thin silt or clay layers is not easily determined. The drill rig bounced and chattered when cobble zones were encountered during drilling, and the presence of these zones was noted on the geologic log.

INSTALLATION OF EXTRACTION WELL

After drilling the pilot hole to 105 feet, the extraction well was installed. The grain size of the sand filter pack and the size of the well screen were designed based on grain-size analyses of sediment samples recovered during drilling. The sand filter pack consisted of Monterey No. 3 sand. The well screen was of the steel wire-wound construction type with 0.030-inch slot size. Well screen and blank casing were 8-inch diameter. The well was screened from 39 to 97 feet below the ground surface. A 5-foot sediment trap was constructed below the well screen.

The sand filter pack was tremmied down the annulus through a tremmie pipe and extended from the bottom of the sediment trap to about 5 feet above the top of the well screen. An approximately 2-foot-thick bentonite seal was emplaced on top of the gravel pack. Cement grout was put in the well annulus from the top of the bentonite seal to the ground surface.

DEVELOPMENT OF EXTRACTION WELL

Development of the extraction well consisted of surging with a surge block, bailing, and pumping and surging with a submersible pump. The well was initially developed by surging the well with a surge block to draw the fine sediments around the well annulus into the well. The well was surged in 10-foot intervals by lowering the surge block to the bottom of each interval and rapidly removing it. Each 10-foot interval was surged about 10 times in this manner. The bailer was then lowered into the well, and the sediment in the well was bailed. However, as the sediment was being bailed out, cobbles up to 2 inches in diameter were bailed out. This suggested that the well screen or casing was damaged during the well installation. A well video-log was performed, but the video camera could not go deeper than 94 feet because of sediment in the bottom of the well. In the top 94 feet, no damage to the well screen or casing was detected. The bottom 8 to 10 feet of the well was then grouted with cement grout, and the well was surged and bailed again.

The next stage in the well development was pumping and surging with a submersible pump. The pump was lowered into the well, and

the well was surged by turning the pump on and off. Initially the water pumped from the well was muddy with some sand. As the well was surged by turning the pump off and on, the specific capacity of the well increased; and the amount of sediment in the water decreased. After about 5 hours of pumping, the specific capacity had increased from about 10 gallons per minute (gpm) per foot of drawdown to 22 gpm per foot of drawdown. The amount of sand pumped by the well had also decreased to 0.2 milligrams per 5 gallons of water.

AQUIFER TESTS

Aquifer tests were performed with the extraction well and with the monitoring wells. The aquifer test with the extraction well will be described first.

Before starting the pump in the extraction well, groundwater levels were measured in the extraction well and the monitoring wells (MW-4B, MW-5, P-1, and P-2). Groundwater levels were measured with an electric sounder. The measuring point for each well was the top of the casing. Groundwater levels were measured in the extraction well and in MW-5 from the time the pump was turned on according to the following schedule:

- Every 1 minute for the first 10 minutes of pumping
- Every 2 minutes for the next 10 minutes of pumping
- Every 5 minutes for the next 40 minutes of pumping
- Every 10 minutes for the next 3 hours of pumping
- Every 30 minutes for the next 3 hours of pumping
- Then every 60 minutes until the pump was turned off

Groundwater levels were recorded in MW-4B, P-1, and P-2 every 1 hour. The data recorded were the time and groundwater level. Drawdown was calculated by subtracting the groundwater level during pumping from the static groundwater level before pumping began. The discharge rate was measured with a flowmeter in gpm, and the discharge was transmitted through plastic hose about 350 feet away from the well toward the southwest before it was discharged to the ground surface.

Two tests were performed with the extraction well because the first test was interrupted when the electric generator quit running. The first test lasted approximately 32 hours while the second test lasted approximately 48 hours. After the well was turned off, groundwater levels were also recorded to the extent possible (the extraction well recovered very rapidly, making it difficult to accurately measure groundwater levels during recovery).

Aquifer tests conducted with the monitoring wells consisted of pumping the monitoring wells and measuring groundwater levels in

the pumping well. In wells A-1, A-2, and A-3, the tests lasted about 2 hours. Groundwater level measurements during pumping were generally taken on the same schedule as for the extraction well discussed above. Discharge rates were measured with a flow meter in gpm, and discharge was transmitted about 50 feet away from the well before it was discharged to the ground. After the pump was turned off, groundwater levels recovered very rapidly making it difficult to record groundwater levels during recovery.

In wells MW-4B and MW-5, pumping at 5 gpm caused the groundwater level to decline below the pump within 2 minutes. These tests consisted of pumping the wells until the groundwater level was reduced below the level of the pump, turning the pump off, and recording groundwater level measurements during the recovery period. Groundwater level measurements were recorded during recovery every 1 minute until the groundwater level had recovered to 95 percent of the initial static groundwater level.

SAMPLING GROUNDWATER FROM MONITORING WELLS

The procedures followed during sampling of the monitoring wells are described in Technical Memorandum No. 8, Groundwater Quality Monitoring Plan.

SUBJECT: Transmittal of PA Field Work Memorandum for January
Document Control No. 04900-003-001-AADU

Dear Ms. Douglas,

ROY F. WESTON, INC. (WESTON) is pleased to submit this Field Work Memorandum for January. This PA Field Work Memorandum has been prepared in accordance with Subtask 1.3 (Reporting) of the Preliminary Assessment Scope of Work to advise both the EPA and the State agencies of site visits tentatively planned during the month of January.

WESTON is tentatively planning on visiting the following PA sites located in California during the month of January:

1.	Site Name and Address:	Guyaux Landfill End of Florez and Fernando Streets Colton, San Bernardino County, California
	EPA ID #:	CAD983652033
	Projected Visit Date:	Week Ending 29 January 1993
	WESTON Contact:	Carol Hays ROY F. WESTON, INC. 1350 Treat Blvd., Suite 500 Walnut Creek, CA 94596-2150

The appropriate State agencies will be contacted prior to the site visit to discuss the objectives of the visit, determine if a State representative will be present, and if necessary, coordinate scheduling.

If you have any questions regarding the information contained in this report, please do not hesitate to contact me.

Sincerely,

ROY F. WESTON, INC.

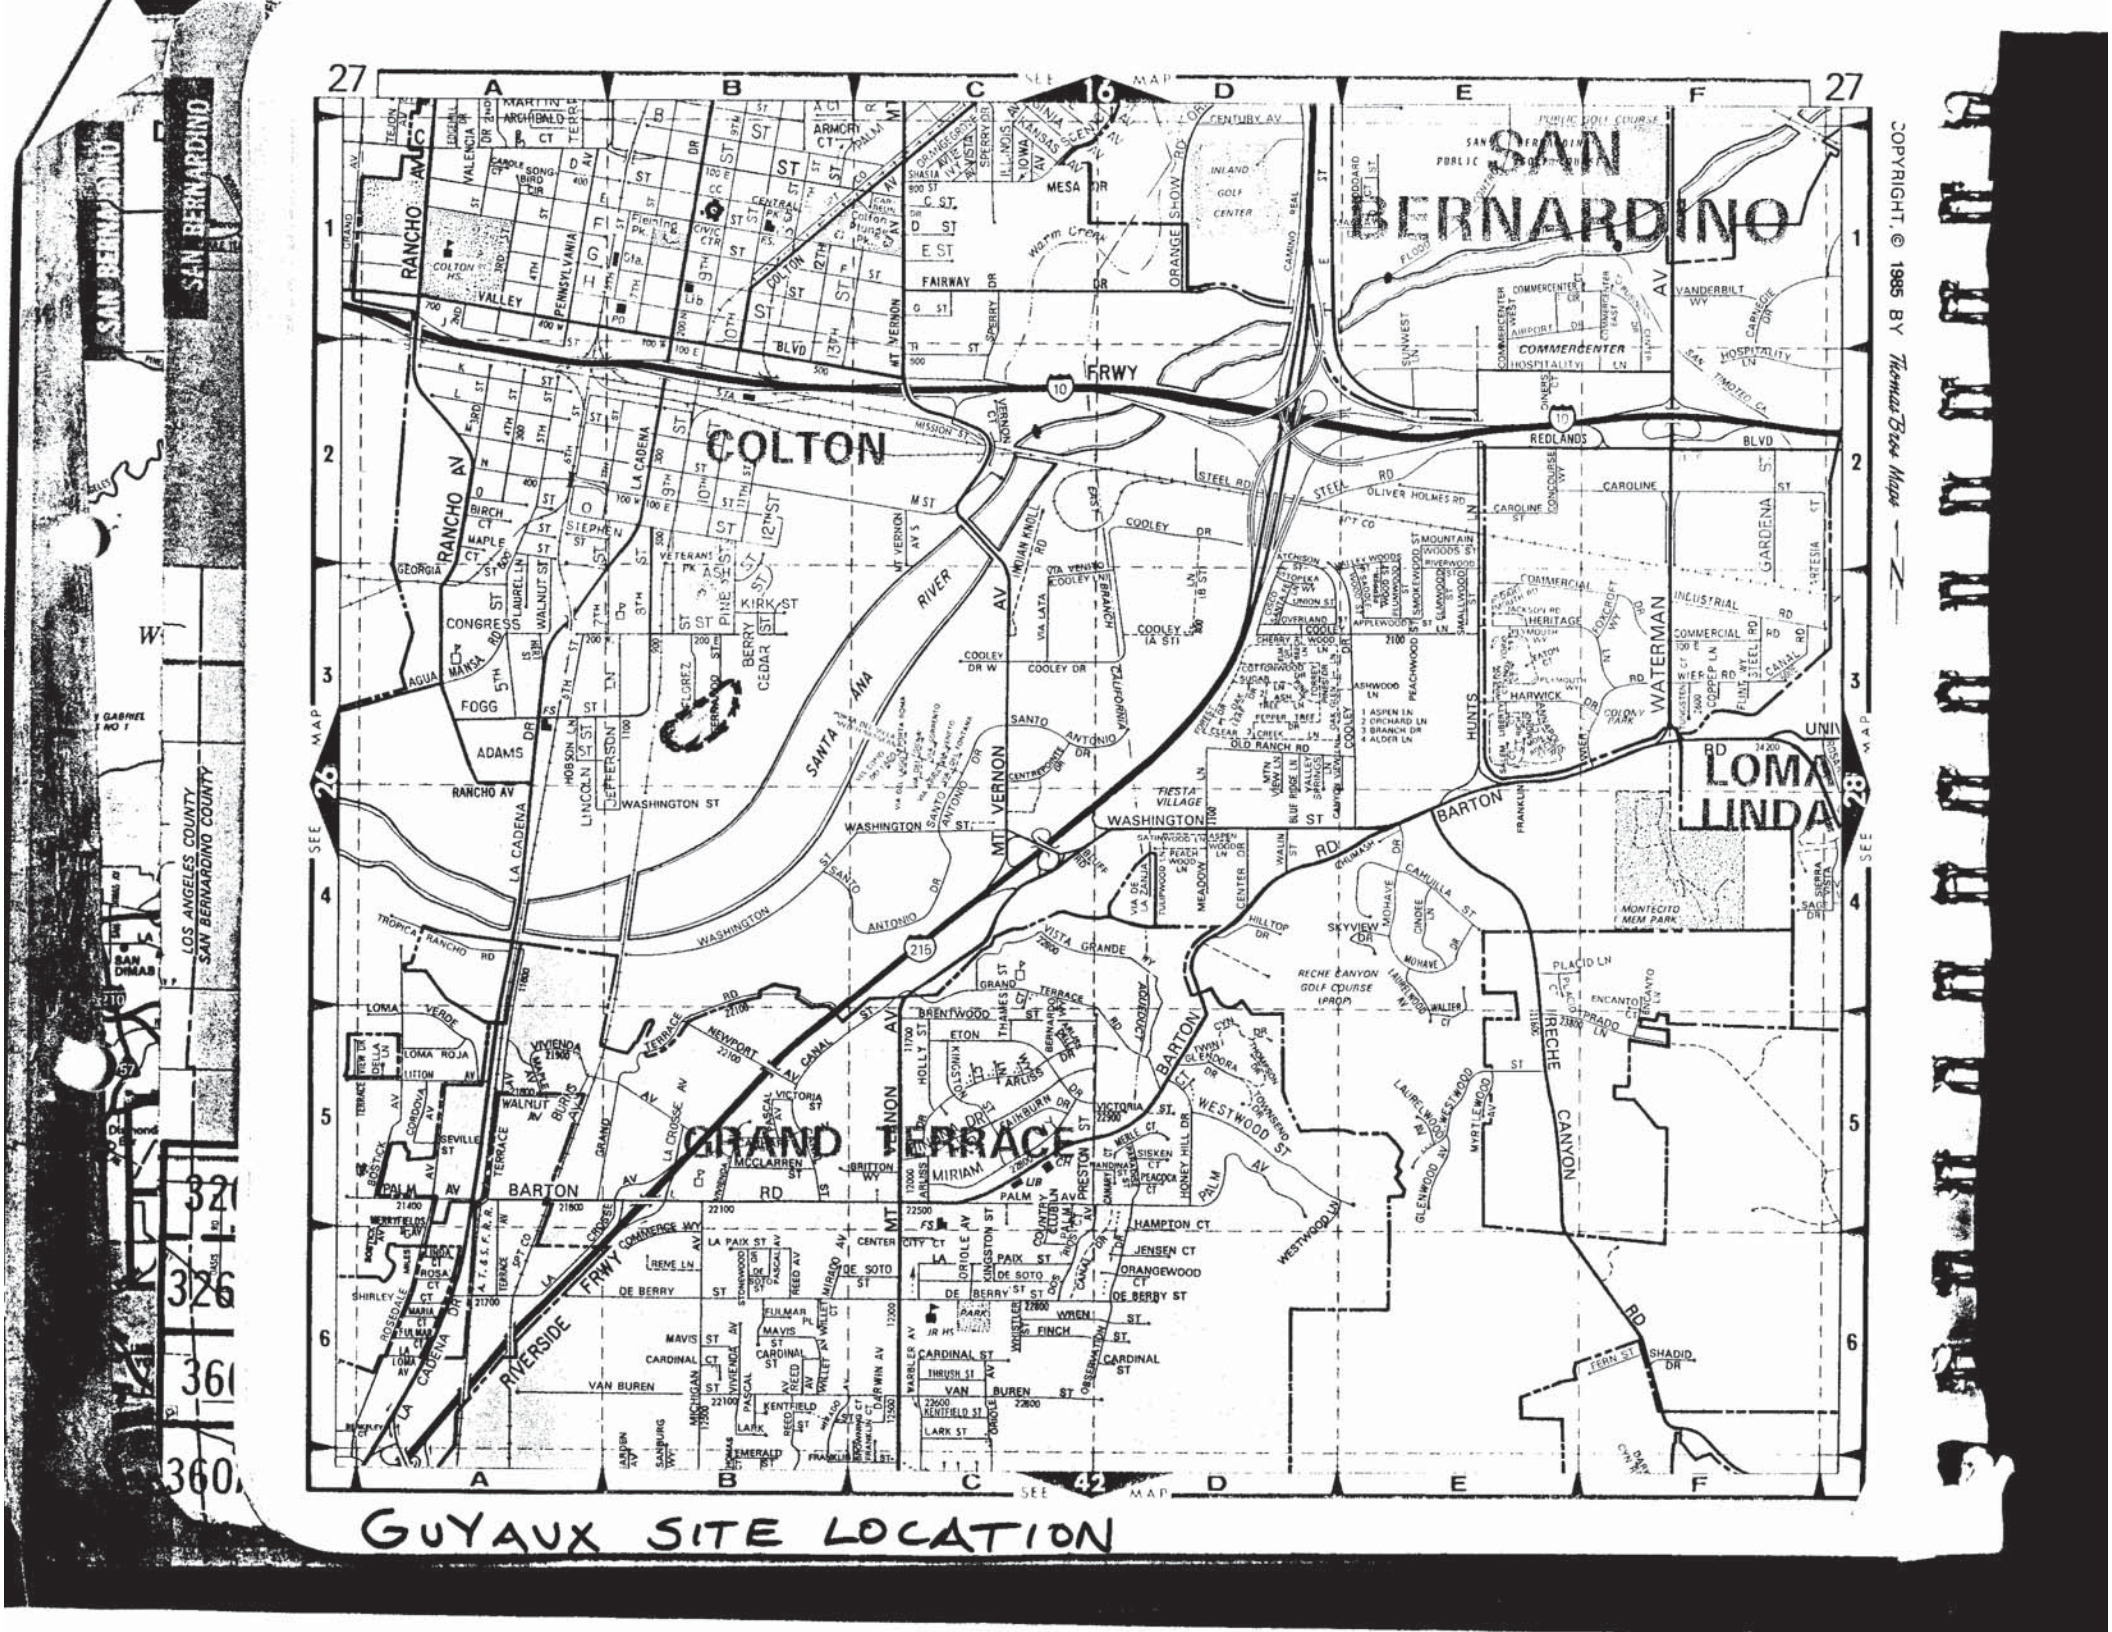
RE: GUYAUX PROPERTY

Dear Ms. Lass:

Thank you for taking the time to talk with me regarding the Guyaux property.



Would you please provide me with documentation of any contamination/violations(s) for businesses or companies that are located by the Guyaux's property in reference to any known past dumping? Additionally, as we discussed, please plan to attend our next City Council meeting on November 7, 1995, at 6:30 p.m., to discuss and answer any questions regarding the above mentioned property. The meeting will be held in the City Hall Council Chambers, located at 650 N. La Cadena Drive.

Thank you in advance for your assistance; I look forward to seeing you on November 7th.

Sincerely,

David R. Zamora
Community Development Director

1.0 INTRODUCTION

The U.S. Environmental Protection Agency (EPA), Region IX, under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA), has tasked Bechtel Environmental, Inc. (BEI) to conduct a site inspection (SI) of the Guyaux Landfill site in Colton, San Bernardino County, Calif.

The Guyaux Landfill site was identified as a potential hazardous waste site and entered into the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) on December 9, 1992 (CAD 983652033). (1) The site was entered into CERCLIS based on the Potential Hazardous Waste Site Identification Form submitted by Roy F. Weston, Inc. to the EPA (2).

A preliminary assessment (PA) of the Guyaux Landfill was completed for the EPA by Roy F. Weston, Inc. on June 10, 1993 (1,2). The purpose of the PA was to review existing information on the site and its environs to assess the threat(s), if any, posed to public health, welfare, or the environment, and to determine if further action under CERCLA/SARA is warranted.

After reviewing the PA, the EPA decided that further investigation of the Guyaux Landfill site would be necessary to more completely evaluate the site using the EPA's Hazard Ranking System (HRS) criteria. The HRS assesses the relative threat associated with actual or potential releases of hazardous substances at the site. The HRS has been adopted by the EPA to help set priorities for further evaluation and eventual remedial action at hazardous waste sites. The HRS is the primary method of determining a site's eligibility for placement on the National Priorities List (NPL). The NPL identifies sites at which the EPA may conduct remedial response actions. This report summarizes the results of the SI of the Guyaux Landfill site.

1.1 Apparent Problem

The apparent problems at the site are as follows:

- In the 1970s and 1980s, waste slag generated at the Griffin Wheel Company site was deposited at Guyaux Landfill. Results of laboratory analyses of the waste slag samples indicated the presence of elevated concentrations of inorganics including arsenic, cadmium, and lead. (3,4)
- Results of laboratory analyses of groundwater samples collected from an agricultural well, downgradient of the site and screened in the drinking-water aquifer, indicated the presence of arsenic at concentrations significantly greater than background levels. (5)

Printed on 50% recycled paper.

2.0 SITE DESCRIPTION

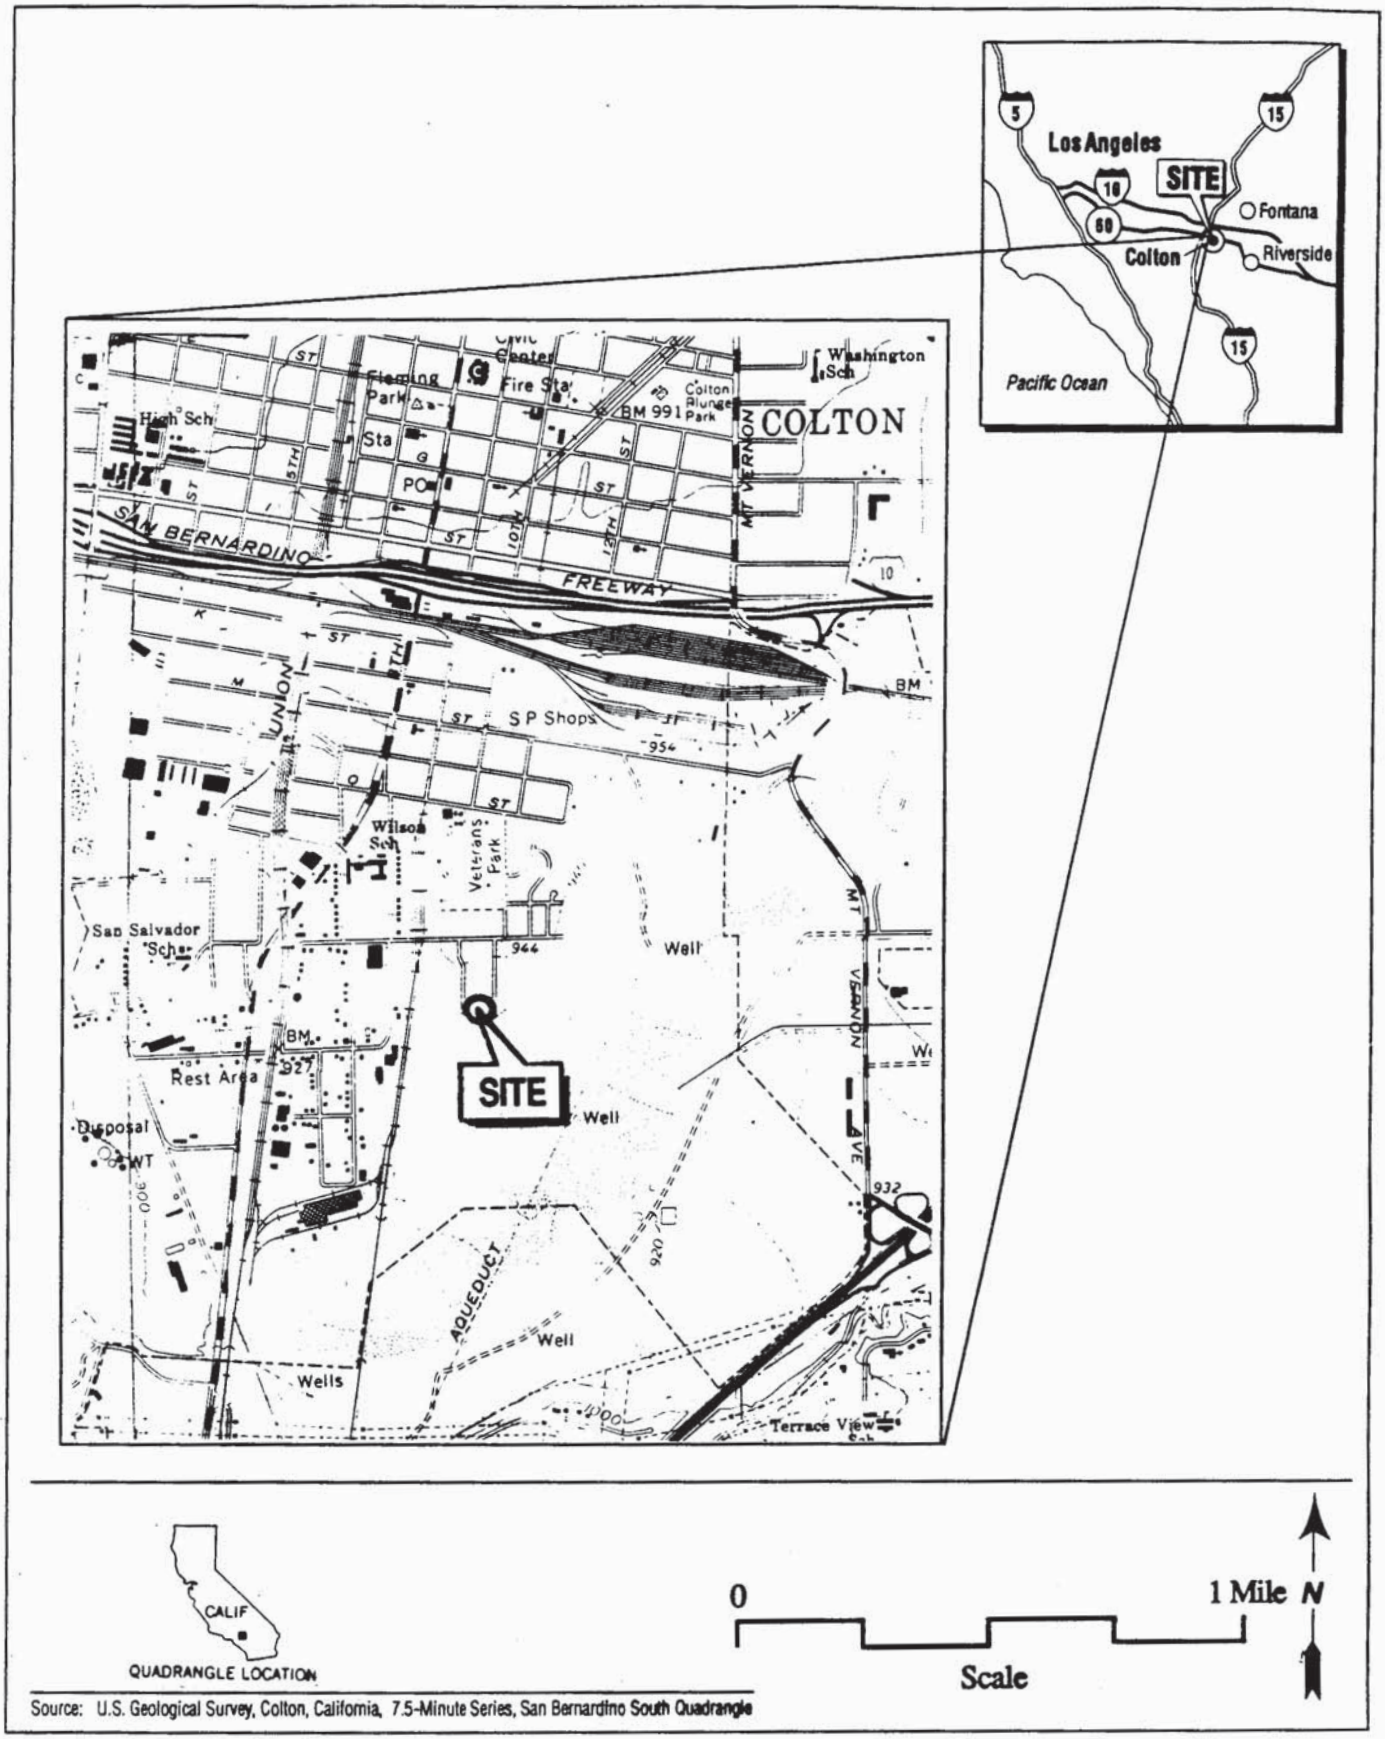
2.1 Location

The Guyaux Landfill site is located at the end of Florez and Fernando streets in Colton, San Bernardino County, Calif. The geographic coordinates for the site are 34° 03' 11.50" N latitude, 117° 19' 15.50" W longitude (Township 1 South, Range 4 West, San Bernardino Baseline and Meridian, San Bernardino South, Calif., 7.5-minute quadrangle) (6). The location of the site is shown in Figure 2-1.

2.2 Site Description

The Guyaux Landfill site is located in an industrial/residential area of Colton, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by vacant land and the Santa Ana River. (7) The site layout is shown in Figure 2-2.

The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill sometime between 1930 and 1985. The rest of the site is in a floodplain. The elevation of the former landfill is approximately 15 feet higher than the rest of the site. The entire site is unpaved, unfenced, and covered by vegetation. (7)



2.3 Operational History

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994. Ralph Guyaux acquired title to the property in July 1994. (7)

Since 1930, 6 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton were disposed of in the landfill portion of the site. In the 1950s, the landfill was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s and 1980s, the landfill was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company sites. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited on the landfill. In addition, the landfill accepted waste slag from the Griffin Wheel Company. Since 1985, the landfill portion of the site has been used for the temporary storage of cars and machinery prior to dismantling and reuse. (7)

At the time of the site visit, piles of waste slag were noted along the face and on top of the landfill. Several piles of used tires and pieces of old furniture were also dumped on site. In addition, up to 10 empty 55-gallon drums were on site. (7)

Printed on 50% recycled paper.

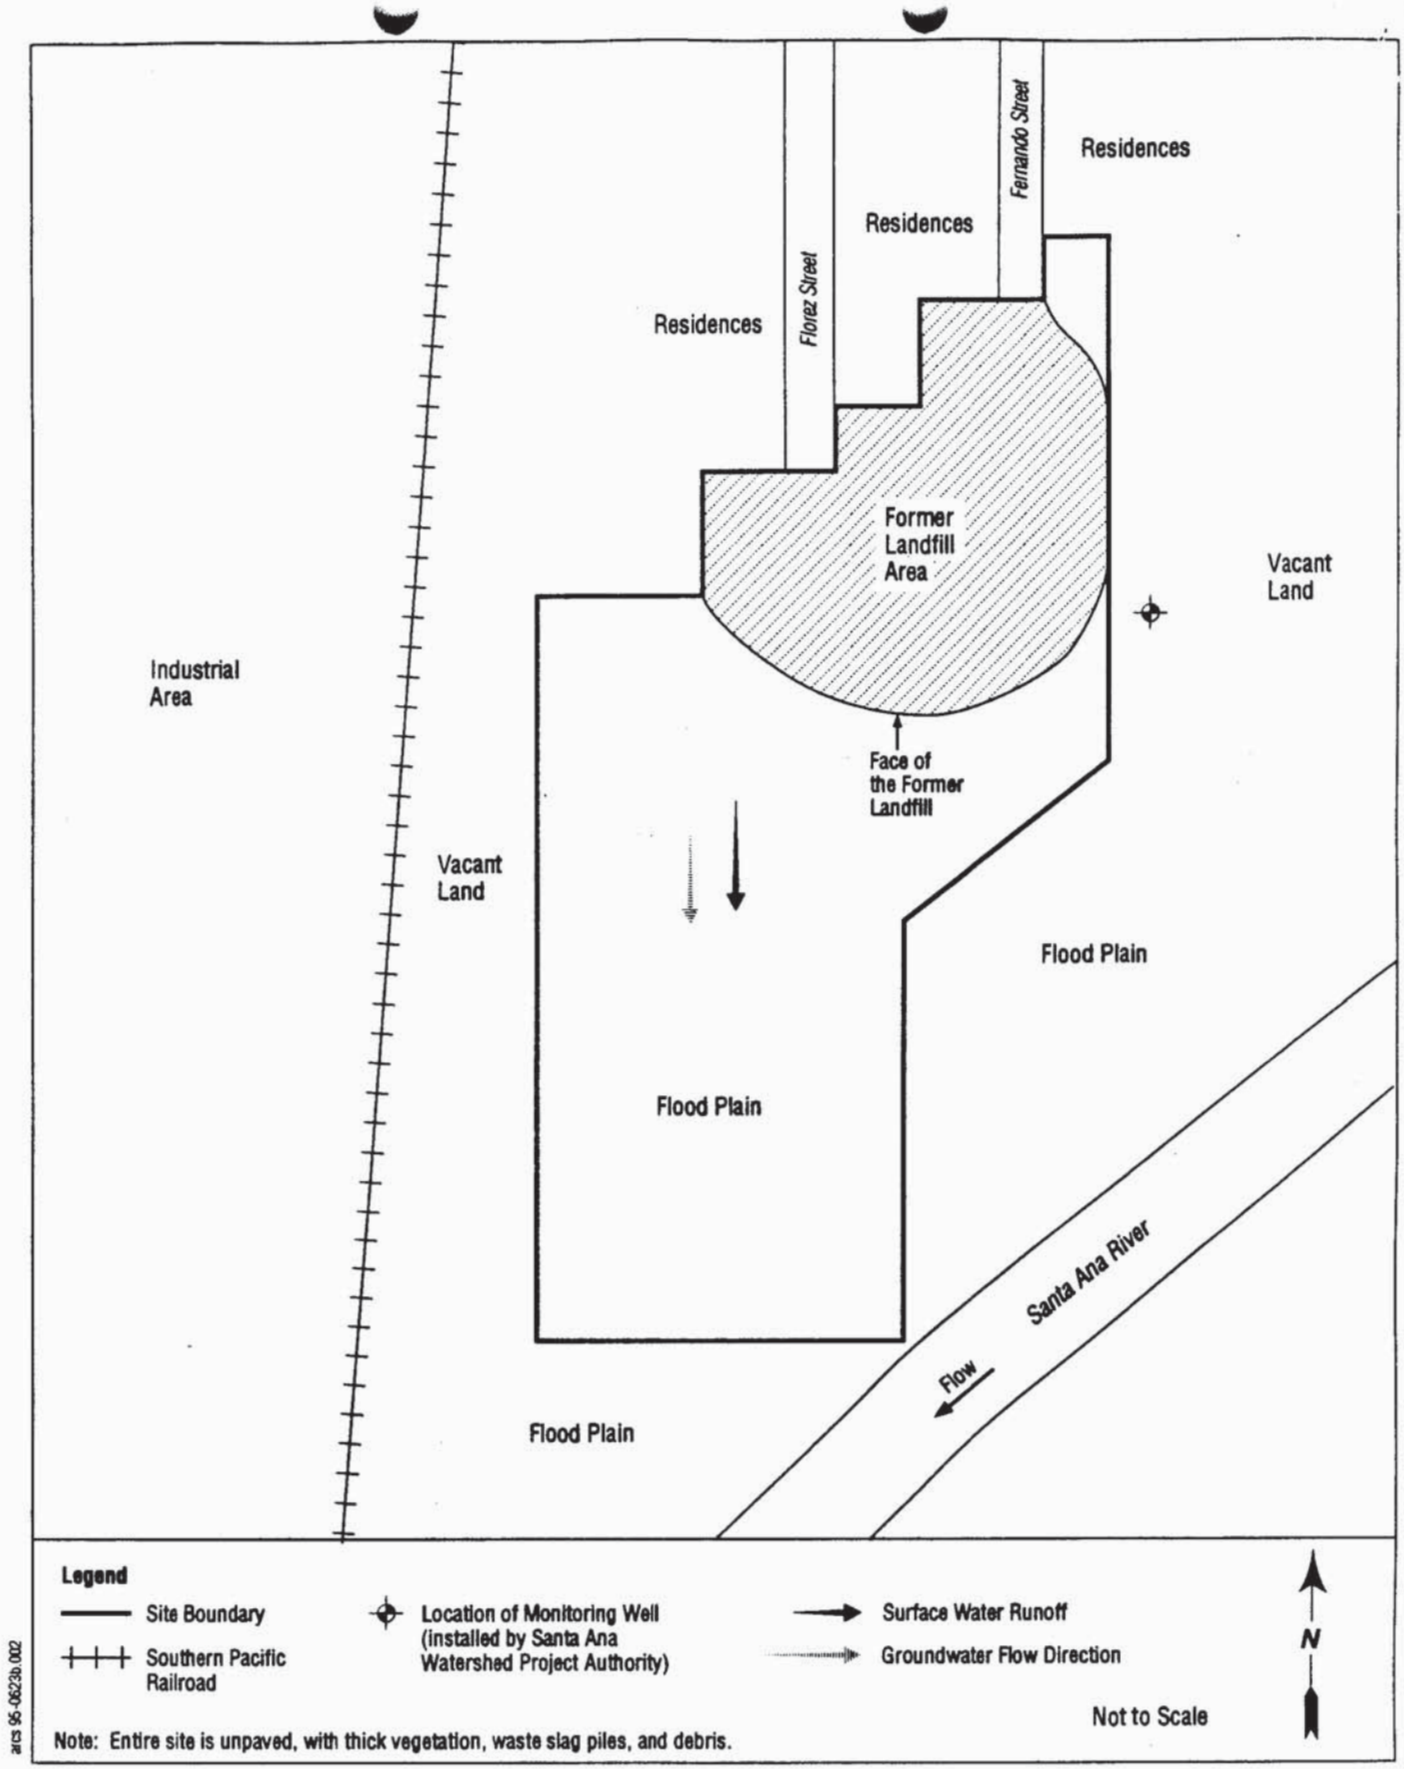

Figure 2-2 Site Layout

2.4 Regulatory Involvement

2.4.1 U.S. Environmental Protection Agency (EPA). The Guyaux Landfill site is not listed in the Resource Conservation and Recovery Information System (RCRIS) database, as of November 22, 1994 (8).

2.4.2 California Environmental Protection Agency.

Regional Water Quality Control Board (RWQCB), Santa Ana Region. The RWQCB has been involved with the site since 1977. In response to a citizen complaint in 1977, the RWQCB requested that the site owner submit a report of waste discharge (ROWD). In response, an incomplete ROWD was submitted by the site owner to the RWQCB. In 1981, the RWQCB requested that the site owner sample and analyze the waste slag. The site owner did not comply with this request. In 1985, the RWQCB requested a groundwater monitoring network around the site. The site owner did not comply with this request. In 1988, the RWQCB requested a Solid Waste Assessment Test (SWAT) from the site owner. The site owner has not responded to this request. (3)

3.0 INVESTIGATIVE EFFORTS

3.1 Previous Sampling and Analyses

3.1.1 Waste Slag Sampling. Waste slag generated at the Griffin Wheel Company was deposited at the Guyaux Landfill site. In 1989, Dames & Moore, contractors to the Griffin Wheel Company conducted a Phase II site assessment at the Griffin site to characterize the waste slag. Eleven soil borings were drilled in the slag pile during this investigation. The slag samples were analyzed for California Code of Regulations Title 22 metals. Results of laboratory analyses of the samples indicated the presence of Title 22 metals, including up to 105 milligrams per kilogram (mg/kg) of arsenic, 72.1 mg/kg of cadmium, and 9,520 mg/kg of lead. (4)

3.1.2 Groundwater Sampling. In 1989, the Santa Ana Watershed Project Authority (SAWPA) conducted a regional hydrogeological study in the vicinity of the site. As part of this study, monitoring wells screened in a shallow perched groundwater zone (approximately 40 feet to 80 feet below ground surface) were installed. Groundwater samples collected from a downgradient monitoring well (A-2) were analyzed for metals. Information on the analytical methods used are not available. Results of laboratory analyses indicated the presence of inorganics including arsenic at 18 parts per billion (ppb) and barium at 69 ppb. (9)

In 1993 and 1994, the City of Riverside sampled the agricultural wells in the vicinity of the site. Groundwater samples collected from an agricultural well (Flume 6) downgradient of the site and screened in the drinking-water aquifer were analyzed for metals using EPA Method 6010. Results of laboratory analyses of the groundwater samples indicated the presence of up to 15 ppb of arsenic. A background agricultural well (Flume 2) also screened in the drinking-water aquifer did not contain arsenic above its method detection limit. (5)

Printed on 50% recycled paper.

3.2 EPA Sampling

No EPA-sponsored sampling has been conducted at this site.

4.0 HAZARD RANKING SYSTEM FACTORS

4.1 Sources of Contamination

Historically, waste slag generated at the Griffin Wheel Company was deposited at the Guyaux Landfill. Results of laboratory analyses of the waste slag have indicated the presence of elevated concentrations of inorganics including arsenic, cadmium, and lead. (4,7)

4.2 Groundwater Pathway

*4.2.1 **Hydrogeological Setting***. The San Bernardino Valley/Upper Santa Ana Valley area is an alluvial plain. It is bounded on the northwest by the San Gabriel Mountains, on the northeast and east by the San Bernardino Mountains, on the southeast by the San Timeteo Badlands, and on the south by the Box Springs Mountains and the Jurupa Mountains. To the west, the area is bordered by the northern Santa Ana Mountains and the San Gabriel Valley. (4)

The Guyaux Landfill site is located partially within the Santa Ana River floodplain. Municipal drinking-water wells in the vicinity of the site pump groundwater from depths that range from 150 feet to 800 feet below ground surface (bgs) (10). Depth to the groundwater in the vicinity of the site is approximately 40 feet bgs (9). Groundwater flow direction in the vicinity of the site is to the south. Shallow subsurface soils beneath the site consist predominantly of silts and sands. (4,7) The 2-year, 24-hour rainfall event for this area is 2.5 inches (11).

*4.2.2 **Groundwater Targets.*** Three drinking-water systems operate municipal drinking-water wells within 4 miles of the site. Forty-nine wells are within 4 miles of the site. The drinking-water systems together serve approximately 283,000 people. The nearest drinking-water well is approximately 0.5 mile northeast of the site. (12,13,14,15)

The City of Riverside obtains almost 100 percent of its drinking water from 48 active groundwater wells that serve approximately 242,000 people. Water from the wells occasionally may be blended with surface water from a single connection maintained by the Metropolitan Water District. Twenty-nine wells are within 4 miles of the site. (12)

The City of Colton obtains 100 percent of its drinking water from 15 active drinking-water wells. The water from these wells is not blended with surface water and is distributed to 8,720 connections. There are approximately 3.1 persons per household for the City of Colton. Fifteen wells are within 4 miles of the site. (13,14)

The Riverside Highland Water Co. obtains 100 percent of its drinking water from 16 active groundwater wells. The blended system serves approximately 14,000 people. Five wells are within 4 miles of the site. (15)

GUYAUX LANDFILL

*4.2.3 **Groundwater Pathway Conclusion**.* Results of laboratory analyses of groundwater samples collected from an agricultural well downgradient of the site and screened in the drinking-water aquifer indicates the presence of arsenic at 15 ppb. An upgradient agricultural well also screened in the drinking-water aquifer did not contain arsenic above its method detection limit. (5) Municipal drinking-water wells in the vicinity of the site are screened at depths ranging from 150 feet to 800 feet bgs (10). Three drinking-water systems operate 49 municipal drinking-water wells within 4 miles of the site. These drinking-water systems serve approximately 283,000 people. The nearest drinking-water well is approximately 0.5 mile from the site. (12,13,14,15)

4.3 Surface Water Pathway

Surface water runoff from the site enters the Santa Ana River. The Santa Ana River borders the site on the southeast and flows to the southwest into the Pacific Ocean, approximately 40 miles from the site. (7) There are no drinking-water intakes along the surface water bodies within 15 miles downstream of the site. Although there are fisheries and sensitive environments within 15 miles downstream of the site, none is in the vicinity of the site (16).

4.4 Soil Exposure and Air Pathway

The site is a vacant area covered with vegetation. Piles of waste slag are on the face and the top of the landfill on site. Analytical results of the waste slag indicate the presence of elevated concentrations of inorganics. Although the site is unfenced, there are no residences, schools, or daycare centers on site. (7)

5.0 EMERGENCY RESPONSE CONSIDERATIONS

The National Contingency Plan [40 CFR 300.415 (b) (2)] authorizes the EPA to consider emergency response actions at sites that pose an imminent threat to human health or the environment. For the following reasons, a referral to Region IX's Emergency Response Section does not appear to be necessary:

- No hazardous substances are generated on site.
- No residences, schools, or daycare centers are on site.

6.0 SUMMARY

The Guyaux Landfill site is located in an industrial/residential area of Colton, San Bernardino County, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by the Santa Ana River. The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill sometime between 1930 and 1985. The entire site is unpaved, unfenced, and covered by vegetation and/or waste materials.

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994. Ralph Guyaux acquired title to the property in July 1994.

Since 1930, 6 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton were disposed of on this portion of the site. In the 1950s, the site was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s and 1980s, the site was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited on site. In addition, piles of waste slag from the Griffin Wheel Company were deposited on site. Since 1985, the site has been used for the temporary storage of cars and machinery prior to dismantling and reuse. Currently, piles of waste slag are along the face and on top of the landfill. In addition, several piles of used tires and pieces of old furniture are on site.

The California Environmental Protection Agency, Regional Water Quality Control Board (RWQCB), Santa Ana Region, has been involved with the site since 1977. The RWQCB has requested that the site owner conduct site-specific soil and groundwater sampling events. The site owner has not complied with these requests.

Three drinking-water systems operate 49 municipal drinking-water wells within 4 miles of the site. These drinking-water systems together serve approximately 283,000 people. The top of the drinking-water aquifer in the vicinity of the site is approximately 150 feet below ground surface. Depth to the groundwater in the vicinity of the site is approximately 40 feet. Groundwater flow direction in the vicinity of the site is to the south. Shallow subsurface soils beneath the site consist predominantly of silts and sands. Surface water runoff from the site enters the Santa Ana River that flows in a southwesterly direction into the Pacific Ocean, approximately 40 miles from the site. There are no drinking-water intakes along the surface water bodies within 15 miles downstream of the site. Although there are fisheries and sensitive environments within 15 miles downstream of the site, none is in the vicinity of the site. The site is covered by vegetation and/or waste materials. No residences, schools, or daycare centers are on site, and the site is unfenced.

The following pertinent Hazard Ranking System factors are associated with the site:

- Waste slag from the Griffin Wheel Company has been disposed of at the Guyaux Landfill site. Analytical results of the waste slag have indicated the presence of elevated concentrations of arsenic, lead, and cadmium.
- Analytical results of groundwater samples collected from the drinking-water aquifer downgradient of the site have indicated the presence of arsenic at concentrations signficantly greater than background levels.
- Three drinking-water systems operate 49 municipal drinking-water wells within 4 miles of the site. These drinking-water systems together serve approximately 283,000 people.

REMEDIAL SITE ASSESSMENT DECISION - EPA REGION IX

Site Name: GUYAUX LANDFILL **EPA ID#:** CAD 983652033

Alias Site Names:

City: COLTON **County or Parish:** SAN BERNARDINO **State:** CA

Refer to Report Dated: 5/15/95 **Report type:** SITE INSPECTION

Report developed by: Bechtel Environmental, Inc.

DECISION:

| | 1. Further Remedial Site Assessment under CERCLA (Superfund) is not required because:

| | 1a. Site does not qualify for further remedial site assessment under CERCLA (Site Evaluation Accomplished - SEA)

| | 1b. Site may qualify for further action, but is deferred to: | | RCRA | | NRC

|X| 2. Further Assessment Needed Under CERCLA:

2a. (optional) Priority: | | Higher |X| Lower

2b. Activity Type: | | PA |X| ESI | | SI | | HRS evaluation

| | Other:

DISCUSSION/RATIONALE:

Report Reviewed, Approved, and Site Decision Made by: Gordon Woodraw **Signature:** Gordon Woodraw **Date:** 6/14/95

Bill Norton	RWQCB	(909) 782-4381	1/20/95	Mr. Norton has been involved with the site. The RWQCB will be issuing a Cleanup and Abatement Order to Ralph Guyaux. As part of site investigations conducted at other sites in the vicinity of the Guyaux Landfill, monitoring wells have been installed and groundwater sampling and analyses have been conducted. I can have access to the reports on the site. I faxed him a copy of the site visit letter.
Julie Johnson	DTSC	(310) 590-4980	1/24/95	The DTSC has no files on the site.
Bill Norton	RWQCB	(909) 782-4381	1/24/95	Mr. Norton stated that Ruth Zandbergen owned the property until last year, when Ralph Guyaux gained possession of the property. He is not aware of any soil or groundwater sampling and analyses conducted on site.
Jim Quint	EPA	(415) 744-2331	2/7/95	Mr. Quint asked me to call Susan Carr, a concerned citizen, and inform her about BEI's evaluation of the Guyaux Landfill.
Susan Carr	Concerned Citizen	(909) 370-2414	2/7/95	Ms. Carr expressed concern about the landfill site. She wanted a copy of the final report mailed to Carmen Kruger 940 Florez St., Colton, CA 92324.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Bill Norton	RWQCB	(909) 782-4381	2/8/95	Mr. Norton stated that monitoring well A-2, hydraulically downgradient of the site, is abandoned and has not been sampled for several years. He asked me to contact Eugene Mcmenas at the Riverside Highland Water Company (909) 825-4128 for more information on hydrogeological investigations in the vicinity of the site.
Eugene Mcmenas	Riverside Highland Water Company	(909) 825-4128	2/9/95	Mr. Mcmenas stated that Lee Slate or Bernie Cavanaugh of the Santa Ana Watershed Project Authority (SAWPA) at (909) 785-5411 were directly involved with the regional hydrogeological study.
Lee Slate	Santa Ana Watershed Project Authority (SAWPA)	(909) 785-5411	2/9/95	Left a message.
Lee Slate	SAWPA	(909) 785-5411	2/10/95	Mr. Slate stated that there have been no additional sampling events conducted in the SAWPA wells in the vicinity of the site since 1989. Only two of the wells still existed and can be sampled.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Lee Slate	SAWPA	(909) 785-5411	2/14/95	The only wells that can be sampled in the vicinity of the site are A-1 and MW-5. The remaining wells have been abandoned. The soil type between the shallow perched zone and the drinking-water aquifer is granular, indicating that the two zones are interconnected.
Lee Slate	SAWPA	(909) 785-5411	2/21/95	Mr. Slate has requested that the laboratory provide him with copies of the raw data pertaining to the SAWPA sampling conducted in 1989.
Lee Slate	SAWPA	(909) 785-5411	3/3/95	Mr. Slate has no additional data to provide on the September 1989 sampling event. Well A-2, downgradient of the site, cannot be traced and appears to be abandoned. No drinking-water intakes that originate in the Santa Ana River. Fisheries and sensitive environments may have habitat in Santa Ana River. However, these targets are unlikely to be in the vicinity of the site.
Dan Randall	City of Riverside	(909) 782-5427	3/15/95	None of the City of Riverside municipal drinking-water wells have been closed due contamination attributable to the Guyaux Landfill site. Municipal wells within 4 miles of the site are screened at depths ranging from 150 to 800 feet bgs.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Bill Norton	RWQCB	(909) 782-4381	3/17/95	The shallow perched groundwater zone is not considered to be an aquifer from an economic standpoint. A perched groundwater zone is considered crictical from an environmental standpoint, since it is a source of evaluating groundwater quality in the drinking-water aquifer beneath it.
Rich Haubert	Riverside Highland Water Company	(909) 825-4128	3/21/95	Mr. Haubert stated that the groundwater flow direction on both sides of the river is the same (to the south). The Santa Ana River neither acts as a discontinuity or barrier to the groundwater flow, nor does it influence the depth to the drinking-water aquifer in any way. The depth to the drinking-water aquifer on either side of the river is approximately 150 feet bgs.
Jack Rowles	City of Riverside	(909) 351-6379	3/21/95 & 4/19/95	The City of Riverside maintains four agricultural wells on the west bank of the Santa Ana River. Mr. Rowles will fax me a copy of the well logs. All the agricultural wells are screened at approximately the same depth intervals. In particular, well flume 6 and well flume 2 are screened starting at approximately 150 feet bgs.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

APPENDIX D

CONTACT REPORT

AGENCY/AFFILIATION: Riverside City Water		CODE:
DEPARTMENT:		
ADDRESS: 3900 Main St.	CITY: Riverside	
COUNTY: Riverside	STATE: CA	ZIP: 92522
CONTACT(S) Dan Randall	TITLE Water Systems Operations Manager	PHONE (909) 782-5427
BEI PERSON MAKING CONTACT: Trey Johnston TJ		DATE: 4/4/94
SUBJECT: Drinking water wells in Riverside, Calif.		
SITE NAME: Riverside Plating	EPA ID: CAD 980885214	

DISCUSSION:

The City of Riverside maintains a blended system of approximately 48 drinking water wells. These wells provide drinking water to approximately 242,000 residents of Riverside, Calif. These drinking water wells may occasionally be blended with surface water from a single connection maintained by the Metropolitan Water District (MWD). When used, this connection may provide up to 1 percent of the drinking water used by the population of Riverside.

Mr. Randall will send a map showing the general locations of the active drinking water wells within the system.

BEI PERSON MAKING CONTACT: Jordie Bornstein JB		DATE: 6/14/94
SUBJECT: Water supply information for City of Colton drinking water wells		
SITE NAME: Crane Co.	EPA ID: CAD 066135690	

DISCUSSION:

The City of Colton currently operates a total of 13 drinking water wells. The water from the wells is not blended with surface water and is distributed through 8,720 connections. Each well contributes approximately equally to the system. Well identifiers and approximate locations are as follows:

- Wells 9 and 17 - west of Adel Ct.
- Well 19 - north of Rialto Ave., between Rancho Ave. and Mt. Vernon Ave.
- Wells 16, 13, and 8 - south of Rialto Ave. near Well 19
- Well 23 - Fairway Dr. near Orange Hill Rd.
- Wells 14, 7, 5, and 6 - south of Walnut Ave. near the railroad
- Well 22 - Rich Dauer Park on Sugar Pine Ln.
- Well 15 - in the middle of Watwood Ave.

In addition, the City of Colton is planning to have the following two wells operating on-line by the end of the summer:

- Katz well - Cooley Ln. near Hunts Ln.
- Well 24 - Meridian Ave. north of Olive St.

SUBJECT: Riverside Highland Water Co. well information		
SITE NAME: Hanford Foundry Co.	EPA ID: CAD 981630833	

DISCUSSION:

The Riverside Highland Water Co. maintains a blended system of 16 operating groundwater wells which serve approximately 14,000 people. Groundwater contributes 100 percent of the drinking water supply. No single well or intake contributes greater than 40 percent of the total supply to the system. Four standby wells are maintained on a regular basis and are used at least once a year. No wells have been closed due to contamination.

APPENDIX E

SITE RECONNAISSANCE INTERVIEW AND OBSERVATIONS REPORT

Bechtel Environmental, Inc.
P.O. Box 193965
San Francisco, CA 94119-3965

OBSERVATIONS MADE BY: Subbu Mahadevan DATE: January 25, 1995

FACILITY REPRESENTATIVE(S) and TITLE(S):

Ralph Guyaux, Site Owner
Bill Norton, California Environmental Protection Agency,
Regional Water Quality Control Board, Santa Ana Region

SITE: Guyaux Landfill

EPA ID: CAD 983652033

A site reconnaissance was conducted at the Guyaux Landfill site on January 25, 1995. The day was overcast with steady rain and the temperature was approximately 55°F. The Bechtel Environmental, Inc. (BEI) representative, Subbu Mahadevan, conducted the site reconnaissance with Ralph Guyaux and Bill Norton at 11 a.m. to gather information on the site location and size, site history, processes used, and any hazardous waste generated, treated, stored, or disposed of on site. The reconnaissance included a site tour during which photographs were taken.

The following information was obtained during the site reconnaissance:

The Guyaux Landfill site is located in an industrial area of Colton, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by the Santa Ana River.

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994. Ralph Guyaux acquired title to the property in July 1994.

The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill sometime between 1930 and 1985. The rest of the site is in a floodplain. The top of the former landfill is approximately 15 feet above the rest of the site. The entire site is unpaved, unfenced, and covered by vegetation.

Since 1930, 6 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton were disposed of in the landfill portion of the site. In the 1950s, this portion of the site was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s, the landfill portion of the site was used as a recycling/disposal yard. Between 1977 and 1985, waste materials from two nearby sites were

deposited on site. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited on site. The landfill also accepted waste slag from the Griffin Wheel Company. Since 1985, the landfill has been used for the temporary storage of cars and machinery prior to dismantling.

At the time of the site visit, piles of waste slag were noted along the face and on top of the landfill. Several piles of used tires and pieces of old furniture were dumped on site. In addition, up to 10 empty 55-gallon drums were on site.

The California Environmental Protection Agency, Regional Water Quality Control Board, Santa Ana Region (RWQCB) has been involved with the site since 1977. The RWQCB has requested a Solid Waste Assessment Test from Ralph Guyaux. The site owner has not complied with this request. No site-specific soil or groundwater sampling events have been conducted. However, slag samples have been analyzed at the Griffin Wheel Company site. In addition, the Santa Ana Watershed Project Authority (SAWPA) has conducted groundwater sampling in the vicinity of the site. A monitoring well installed by the SAWPA is outside the eastern boundary of the site.

Groundwater flow direction beneath the site and surface water runoff across the site are to the south. Surface water runoff from the site flows into Santa Ana River, which flows into the Pacific Ocean, approximately 40 miles downstream of the site.

MEMORANDUM

DATE: February 22, 1995

TO: Dixie Lass, Chief
Land Disposal Section

FROM: William Norton
William Norton, ES III
Land Disposal Section

SUBJECT: Guyaux Landfill (located in City of Colton) - background and rationale for not taking enforcement action.

RECENT CHRONOLOGY

Nov. 30, 1994

I received a complaint at about 4 p.m. by phone from Colton citizen Suzanne Carr that landfilling or grading was taking place at the site as we were speaking on the phone. When I went to the site at 4:30 p.m. the same afternoon, no activity, or evidence of activity, was noted.

Dec. 7, 1994

Bruce Paine, John Fernald and I met with Suzanne Carr, and representatives of San Bernardino County Hazmat, the LEA, Riverside Highland Water Company, and several residents who lived in the adjacent neighborhood. A reporter from the San Bernardino County Sun newspaper named Cerise Valenzuela also attended (without our knowledge or prior approval). There was a joint discussion of the landfill history and possible hazards and potential actions by various agencies. We received a copy of the USEPA Preliminary Assessment Report, dated June 9, 1993, and written by Roy F. Weston Inc.

Dec. 8, 1994

An article about the landfill appeared in the San Bernardino Sun. We received a copy of the hydrogeological investigation which was done for the SAWPA RIX Demonstration Project in 1989.

Dec. 11, 1994

A second article about the landfill appeared in the San Bernardino Sun.

Dec. 12, 1994

Bruce Paine of our office received a call from San Bernardino County District Attorney Joe Johns, expressing interest in pursuing a case against Ralph Guyaux. We set a meeting on the topic for late January.

Dec. 14, 1994

A third article about the landfill appeared in the San Bernardino Sun.

Jan. 10, 1995

We received a copy of **current** title information on the landfill. The County document indicated that Mr. Ralph Guyaux "acquired" the property in November 1973, and received title in July, 1994.

Jan. 19, 1995

Bruce Paine, Dixie Lass and I met with San Bernardino County District Attorney Joe Johns at the Hazardous Materials Investigation Task Force meeting. We briefed Mr. Johns and several other agency officials about the site at this meeting. We told the group that we were seriously considering taking enforcement action at the site based on water quality concerns.

Jan. 24, 1995

I spoke to Ruth Zandbergen, the prior owner of the property. She informed me that Mr. Guyaux began paying on a note to her deceased husband in 1973, and received title to the property after paying off the note in July of 1994.

Jan. 25, 1995

I accompanied Subbu Mahadevan from Bechtel Environmental Inc. on a site inspection he was conducting for USEPA. This was a follow-up inspection for the preliminary assessment conducted for USEPA by Roy F. Weston Inc. in 1993. We both met Ralph and Charlotte Guyaux at the site, and spoke to them about the history of the property, as well as present concerns and issues relating to it.

Jan. 26, 1995

Just prior to drafting a cleanup and abatement order, I conducted a more detailed review of the RIX hydrogeologic investigation, which was done in the vicinity of the site. Following this review, and after consulting with a staff member familiar with the RIX project, and with Dixie Lass and Kurt Berchtold of RWQCB

management, it was decided that enforcement action would not be appropriate at this time.

REASONS FOR NOT PURSUING ENFORCEMENT ACTION AT GUYAUX SITE

1) Based on well data from three wells in the RIX study (one upgradient, one 200 ft. immediately downgradient, and one between those two), the site does not appear to be having a significant impact on groundwater. Volatile organic compound (VOC) levels detected in the downgradient well (17 ppb PCE, 2 ppb TCE) seem consistent with levels found in many wells in the surrounding area. These wells are both up and downgradient of the landfill, and are commonly believed to be from a VOC plume originating from one or more sources in the area. The RIX study well upgradient of the site had a TCE level of 12 ppb (the Primary Drinking Water Standard for TCE is 5 ppb).

   Some metals, such as arsenic and barium, are **slightly** higher in the downgradient RIX well than the upgradient well. Only selenium exceeds the Primary Drinking Water Standard, and upgradient levels, but the exceedence of the standard is slight (about three times the standard - 32 ppb compared to a standard of 10 ppb). In addition, the downgradient RIX well sample was **not** filtered, which means the analysis of the sample included dissolved and suspended metals, which is not true of the two upgradient wells used for comparison. The result is that the metals levels found in this well may appear higher than the upgradient wells due to the difference in sampling technique.

2) The site is well graded and drains well, with no observed ponding during my last inspection, which was conducted in a substantial rain storm.

3) The site has not received wastes (other than tires and some refuse) for more than 12 years. Most of the wastes have probably been in place for more than 30 years. This leads us to hypothesize that if any significant VOC plume (significantly greater than the observed background levels) or metals were to appear in the downgradient well, they probably would have shown up during the RIX study sampling in 1989.

4) The RIX report established groundwater elevation and direction, an initial estimate of hydraulic conductivity of the water bearing zone, and yielded borehole and water quality data both upgradient and downgradient of the site. There is little that a further groundwater investigation could achieve, other than ongoing monitoring of these wells

for possible future changes in groundwater quality. Unfortunately, the downgradient well appears to have been backfilled with grout and abandoned.

Re: Scheduled Site Visit

Dear Mr. Guyaux:

Bechtel Environmental, Inc. (BEI) is currently a contractor to the U.S. Environmental Protection Agency (EPA) under EPA Contract No. 68-W9-0060. Pursuant to Section 104 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA or Superfund), as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA), and to Section 3007 of the Resource Conservation and Recovery Act of 1976 (RCRA), as amended by the Hazardous and Solid Waste Amendments of 1984 (HSWA), the EPA is conducting a nationwide inventory and screening of sites and facilities where hazardous substances may be located. Under the contractual relationship with the EPA, BEI is responsible for assisting the EPA in identifying and investigating such potential sites.

The Guyaux Landfill site came to the EPA's attention based on a complaint to the EPA by Roy F. Weston, Inc. The Guyaux Landfill site was subsequently entered into the EPA's Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database and preliminary assessment (PA) was conducted in June 1993.

The EPA has requested BEI to conduct a site inspection (SI) of the Guyaux Landfill site. An SI is an investigation of CERCLIS sites that have been through the PA stage of the CERCLA assessment process. As part of the investigation, SI investigators collect available information, conduct a "walk around" of the site and its immediate environs, and interview the site representative. The SI is designed to complement information collected at the PA stage in order to determine whether a site poses a threat to human health and the environment. The SI also identifies sites requiring assessment for possible emergency response actions.

As we discussed in our phone conversation on January 17, 1995, a site visit at Guyaux Landfill is scheduled for the following date and time:

Wednesday, January 25
10.00 a.m.

Upon arrival at the site, BEI representatives will produce a letter of introduction duly designating BEI to conduct an SI at the facility. We will take photographs and collect information about the site, which will be incorporated into the SI. After the site tour, we would like to meet with you to discuss the information requested by this letter.

Pursuant to applicable provisions of Section 104 of CERCLA; Section 3007 of the Resource Conservation and Recovery Act (RCRA); Section 9 of the Federal Insecticide, Fungicide, and Rodenticide Act; Section 3 of the Toxic Substances Control Act; and Section 308 of the Clean Water Act, EPA hereby requests that you make the following information available to BEI at the time of the facility visit:

- Ownership and operational history of the site.
- Site plans, facility maps, and historical aerial photographs, if available, showing the locations of any hazardous substances, pollutant or contaminant, management activities, wells, buildings, drainage, and any other relevant features.

- List of all hazardous substances, pollutants or contaminants generated, stored, treated, transported from or disposed of at the facility, including dates and amounts, if known.
- Description of past and present waste management practices, including onsite generation, storage, treatment, disposal or removal of hazardous substances, pollutants or contaminants.
- Description of all onsite hazardous substances or pollutants and contaminant storage, treatment or disposal areas, including size, containment features, dates used, and amounts of materials stored, treated or disposed of.
- Description of any releases of hazardous substances to the environment, including dates and regulatory agency response to the releases, if any.
- Description of any environmental or public health regulatory or enforcement agency involvement at the facility.
- Description of all federal, state, and local permits held by the facility, include permit number, issuance and expiration dates. Also describe any occurrence of noncompliance with these permits.

Please see the accompanying attachment regarding disclosure and confidential business information. If you wish to comment on the EPA's disclosure of the requested information to BEI, you must do so in writing within 5 days of your receipt of this letter. If you wish to make a confidentiality claim regarding any of the information, the claim must be submitted, along with substantiating comments, within 15 days of your receipt of this letter. Submit any such comments to:

Thomas A. Mix, Chief
Site Evaluation & Grants Section (H-8-1)
U.S. Environmental Protection Agency
75 Hawthorne Street
San Francisco, CA 94105

Please call me if you wish to discuss this letter or our upcoming visit. I may be reached at (415) 768-7111. Please feel free to invite anyone to the meeting and site visit who can provide the information requested above. You may also discuss this matter with Philip Armstrong, EPA Region IX Work Assignment Manager, at (415) 744-2349. I look forward to meeting with you at the Guyaux Landfill site.

Respectfully yours,

Subbu Mahadevan

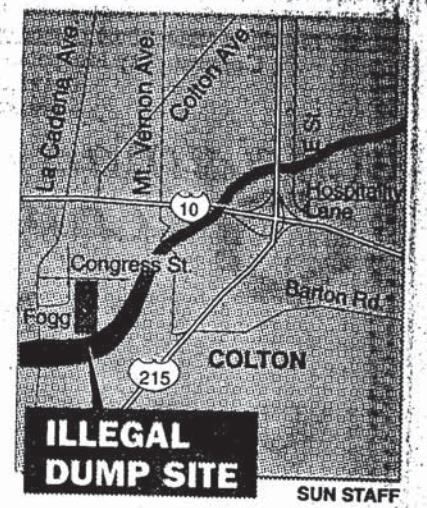
Residents sick, tired, say toxins to blame

■ The Environmental Protection Agency plans to sample the groundwater and soil in south Colton to determine whether poisons have leaked into them.

ENVIRONMENT



By ILENE LELCHUK
Sun Staff Writer

COLTON — Last week, the 17-acre dirt lot at the end of Florez and Fernando streets looked the way it should have 20 years ago.

Peering through a shiny new chain-link fence posted with a "No Dumping" sign, no one would guess piles of tires, metal, wood and chemical or oil drums decayed there for decades.

No one, that is, except the residents of this predominantly Latino, middle-class neighborhood, who now say what lies beneath the dirt may be slowly killing them.

While the owner of the once illegal dump says he did his part to clear the junk this month, the U.S. Environmental Protection Agency is trying to determine whether the land is so badly damaged that it qualifies as a Superfund site — a class reserved for the country's worst environmental hazards.

SUN STAFF

"It looks nice, but it's still a dump. A dump is a dump," said Carmen Kruger, 52, a lifetime resident of Florez Street.

Kruger is one of several residents who have spent the past 20 years at war — and not just with property owner Ralph Guyaux.

They battled snakes, scorpions, centipedes, rats and flies they say came from the dump,

See TOXINS/B2

The Sun
SUNDAY, October 29, 1995

Toxins: Residents sick

Continued from B1

which sits near the Santa Ana River bed.

And they are still at war, but with an enemy they can't see.

Acting on their complaints, the EPA announced this week that it will sample the groundwater and soil to learn whether poisons leaked into south Colton's drinking water or if the dust contains hazardous materials that can end up in people's lungs.

"We just don't know enough information about it now," said Gordon Woodrow, EPA Superfund assessment manager.

Tests will begin in the coming weeks. It's not known when the results will be available.

The most recent tests were performed in 1993 and 1994 by the EPA and the state Water Quality Control Board.

Both agencies identified arsenic, copper, zinc, lead, cadmium and other potentially hazardous materials, but they determined there was no direct evidence that the trash was a major problem.

■

When Ralph Guyaux bought the land in the mid-1970s, it was already a well-known dumping ground.

It took neighbors' complaints, city fines and finally a judge's order to force him to halt dumping there and clean up the mess.

Under the court order in August, Guyaux had to clear the land and fence it by last Tuesday.

At Wednesday's City Council meeting, Community Development Director David Zamora declared the job done.

Guyaux presented receipts and work order forms to prove tires were hauled away and the fence was built, Zamora said.

Kruger, her brother Epigmenio Roman and her sister Rachel Warner — who live in separate houses on Florez Street — say they have photos to prove Guyaux actually buried some debris.

THE HISTORY

Documents show dumping began about 50 years ago on the 17-acre site at the end of Florez and Fernando streets in south Colton. The city has no record that permits were issued to allow legal dumping there.

■ **1977** — About 23 residents sign a petition asking the city to stop dumping and require property owner Ralph Guyaux to fence the lot.

■ **May 1981** — The Regional Water Quality Control Board asks Guyaux to test piles of black slag on his land; neighbors complained of black dust on their cars and in their homes.

■ **December 1981** — Guyaux tells the board that the test results were either lost or never reported. Requests by the water board for monitoring the property in 1985 and 1988 are not answered.

■ **1993** — An EPA study identifies arsenic, copper, zinc, lead, cadmium and chromium in the soil and waste, calling them a potential threat to residents and groundwater.

■ **July 24, 1995** — After several attempts to force Guyaux to clear his lot, the city takes him to court. The court orders him to clean the debris by Oct. 24 and fence the land. He also is ordered to pay the city $225 for administrative fees.

■ **Aug. 16, 1995** — The city inspects the land and finds no progress.

■ **Oct. 25** — A city official announces that Guyaux cleared and fenced his land.

In several pictures shown to the City Council, drums appear to be half-buried, and bulldozers seem to be moving earth to cover the trash.

"My concern here is everyone is talking about a superficial fix," Roman told the City Council on Oct. 3.

Zamora said his staff monitored the cleanup three times a week and saw no burials.

Guyaux also denies the claims.

"We have done everything in our power to be good neighbors," Guyaux said at that same Oct. 3 meeting.

In the landfill's earliest known history, the city dumped debris there after a flood wrecked Colton in the 1930s.

Later, various companies dumped there, although no landfill permits were issued by the city or state.

The City Council denied Guyaux's request for a permit in 1978.

Guyaux denied that he allowed dumping anyway.

"If you believe everything said tonight, I should probably be hauled off to jail," he said at th council meeting.

Guyaux did not return cal last week.

■

Twenty-eight-year-old Berth Marquez shakes out her shoe pants — even her underwear - before putting them on.

She fears the day a scorpio or snake falls out.

"We're tired of it," she sai "I'm afraid to walk around m house barefoot."

Marquez lives on Fernand Street with her 7-year-old so and her parents.

They bought one of the fe new single-story homes built ne to the dump about two years ago

Since then, they found a po sonous snake in their oven, h son can't play in the yard becaus he gets throat infections, he mother developed a cough ar her father is plagued by dai headaches.

"Believe me," she said, " they told us all this stuff wou happen to us, my parents wou never have moved here."

Old dump site target of probe

By CERISE A. VALENZUELA
Sun Staff Writer

ENVIRONMENT

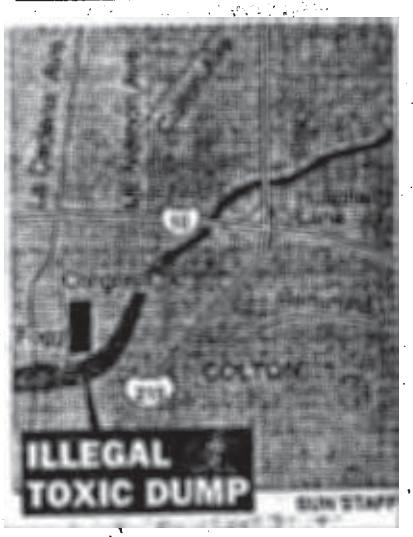
COLTON — County environmental health officials agreed Wednesday to investigate complaints by residents about years of illegal dumping on a vacant lot near their homes.

"There were about 40 gasoline storage tanks on the property at one time," said Epigmenio Ramon, 48, who lives on Florez Street near the dumping site.

"I could smell strong odors, but I always assumed it was gasoline. I'm worried about my family and the children that play in that area."

Ramon and five other residents met in Riverside with representatives from the California Regional Water Quality Control Board and the San Bernardino County Department of Environmental Health Services to discuss their claims.

Documents show dumping began 50 years ago at the 17-acre site at the end of Florez and Fernando streets in South Colton.



Colton Community Development Director David Zamora said the city has no record on file of permits allowing the property to be used as a landfill. The city has taken the owner, Ralph Guyaux, to court several times recently to make him clean the land, Zamora said.

Guyaux seems to be complying, Zamora said.

But the residents said he is only burying the sludge and debris and pushing it closer to the edge of the property, which adjoins the Santa Ana River, a state water source.

Guyaux did not return calls to his home in Riverside.

Photographs of the property, taken by Colton resident Suzan Carr, show mounds of more than 300 tires, an abandoned oil tanker, cracked pipes, building materials and drums possibly containing hazardous chemicals.

The property owner can be held liable for the waste on his land, said Jim Trujillo of the county department of environmental health services.

Ramon and 22 other residents signed a petition in 1977 asking the city to require that the land be fenced and the dumping halted. The planning commission denied a conditional use permit for a landfill on the property in May 1978. The city has no record of any permits afterward. But the dumping continued.

Rachel Warner said she and some of her neighbors suffer from headaches they feel are caused by the smell, dust and soot from the dump site.

The U.S. Environmental Protection Agency hired a consultant to assess the property in 1993. The study identified arsenic, copper, zinc, lead, cadmium and chromium in the soil and waste and a potential threat to residents and groundwater.

City officials were told of the results, but there is no record of any follow up.

Agency will test illegal dump site

■ The U.S. Environmental Protection Agency will test soil and water at an illegal Colton dump site.

By CERISE A. VALENZUELA
Sun Staff Writer GST 12/14

Environmental protection officials said Tuesday that an engineering firm will test soil and water at an illegal Colton dump site, more than a year after a federal report recommended the study.

Recent news articles in The Sun about the 17-acre site prompted the EPA's response, said Thomas Mix, a section chief in charge of site evaluations and grants for the U.S. Environmental Protection Agency.

"Because of concerns about the report, we thought maybe this was important and should be looked at," Mix said.

The property, owned by Ralph Guyaux of Riverside, is less than a quarter mile from Woodrow Wilson Elementary School and within a few feet of homes on Florez and Fernando streets.

Guyaux, who holds no permits in the city or the state to use the site as a landfill, has not returned repeated calls from The Sun.

If the EPA determines the land needs to be cleaned, the agency could force Guyaux to pay for it.

The Santa Ana Regional Water Quality Control Board said last week it will ask Guyaux to pay for water tests.

Residents said they felt slighted by the city, county and environmental officials because they began complaining about the dumping in the 1970s.

"It makes me feel like we've been forgotten out here," said Carmen Kruger, a resident of Florez Street. "We've been ignored all these years.

"If they're going to do studies now, there must be something wrong there."

ENVIRONMENT

Krueger said she credited Colton resident Suzan Carr for taking the area residents' concerns to the city. That prompted county water and environmental officials to meet with them Dec. 7.

As early as 1977, 23 area residents signed a petition asking the city to require that the land be fenced and the dumping halted.

Colton denied a conditional use permit for a landfill in May 1978.

The city has no records of any later permits, but dumping continued.

Weston Co.'s June 1993 assessment of the property identified hazardous chemicals in a nearby water well and several possible hazards on the Guyaux land.

Heavy machinery, automobile frames, telephone poles, oil tanks, chemical drums, tires and slag lie on the site.

The city recently sued Guyaux to remove the debris. Much of the large machinery has been dismantled and taken for scrap.

On Friday, EPA spokeswoman Paula Bruin said the agency was still evaluating the site along with other locations vying for attention.

On Tuesday, Mix said engineers with California-based Bechtel Environmental Inc. might visit the dump site as early as mid-January, then will be asked to develop a plan for testing the soil and water.

Testing is not expected to begin until March and results could take at least 45 days, he said.

Mix did not know how much the company would be paid to examine the Colton site and four other, unrelated California sites.

But if the company must drill wells to pull water from the ground system, the cost could be as much as $50,000, said Philip Armstrong, an EPA work assignment manager.

Illegal dump site target of complaints

Sunday
Dec. 11, 1994

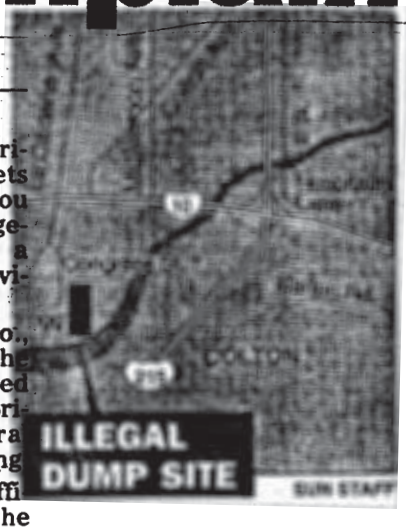
■ South Colton residents say their complaints about the dump have been ignored for more than 20 years.

By CERISE A. VALENZUELA
Sun Staff Writer

ENVIRONMENT

Environmental Protection Agency officials were unable to say last week where an illegal dump in Colton stands on a national prioritized list of potentially hazardous sites in need of cleaning.

South Colton residents claim the city and county water and environmental specialists have ignored their complaints about the dump for more than 20 years.



But federal EPA representatives said Friday that they are still evaluating the 17-acre site, one of many vying for the agency's attention.

"It's kind of like a Miss America pageant and everybody gets miss congeniality and then you just have to see who's most congenial," said Paula Bruin, a spokeswoman for the U.S. Environmental Protection Agency.

Stockton-based Weston Co., hired by the EPA to assess the property in June 1993, suggested that the site be given high priority and be considered for federal Superfund money for its cleaning.

Weston spoke with city officials during the study about the possible hazardous chemicals in the soil and waste and in a nearby water well.

But records from the city, county and EPA show that nothing was done when the property owner Ralph Guyaux failed to comply with requests to test the soil.

Bruin said the EPA is following federal guidelines on reviewing dump sites and the process sometimes takes years.

"There are just thousands and thousands of other sites competing for the money and the resources," Bruin said. "I wish I could wave a magic wand and make all the residents' concerns go away, but there is a process," she said.

The Guyaux site is less than a quarter mile from Woodrow Wilson Elementary School and within a few feet of homes on Florez and Fernando streets.

Neither the city nor the state hold permits for a landfill there. The City Council denied Guyaux's last request for a permit in 1978. No records of previous permits exist.

Guyaux has declined to return repeated phone calls from The Sun.

Photos taken by residents show the following items on the property: heavy machinery, car and truck frames, two oil tanks, chemical drums, telephone poles, concrete, bricks, asphalt, tires, trash, steel, toilets, and slag.

The heavy machinery and telephone poles remained on the site Friday. The drums and other debris has been pushed away from neighboring homes to the edge of the Santa Ana River bed which runs through the property.

The city recently took Guyaux to court to demand removal of the debris.

Fernando Street resident Librado Arellano and his wife have witnessed people drive to the end of their street and dump truckloads of furniture, tires and rubbish.

The Arellanos, who have lived next to the dump for more than 22 years, feed a family of wild cats to keep the rats, gophers and snakes away from their home.

"We have tried to sell our house," Arellano said. "No one will buy it because of the dump."

The city recently posted signs proclaiming "no dumping," but the property remains accessible.

Several new homes have been built on Florez Street at the northern edge of the landfill. The area homes are owned by mostly Latinos.

"People say we want to live like this and to leave it alone," said Carmen Kruger, who lives on Florez Street. "But it's not true. Just because we live in South Colton doesn't mean we deserve to be treated like this and ignored."

Joan Mulcare, a division chief with the County Department of Environmental Health Services

Dump: Site target of complaints

Continued from B1

said Friday that the agency has decided to demand soil testing.

She said Guyaux will be contacted by letter and requested to do the tests. However, if he is uncooperative the county will order the tests and then bill Guyaux for the costs, Mulcare said.

The tests are necessary to determine if oils or hazardous metals are in the soil. Trenches will be dug for soil samples at several depths, she said.

Mulcare said she was unaware of whether Guyaux had been contacted yet and she did not know how quickly results might be available.

The Guyaux land was reported as a potential hazardous waste site and illegal dump site in December 1992 after the Weston Co. completed a study of the nearby Griffin Wheel Co.'s dump.

The EPA listed the site in its computer database for hazardous locations and most of the waste at Guyaux's site was from the nearby Crane Co. and the Griffin Wheel Co.

Similar waste at the Griffin Wheel Dump contained elevated levels of arsenic, copper, zinc, lead, cadmium and chromium, according to the 1993 Weston report.

Waste found at the Crane Co. contained elevated levels of barium, cobalt, nickel and zinc. But no studies were done on waste found at the Guyaux site.

The 1993 study also confirmed the dumping had taken place on the land since the 1930s when the city first began dumping construction debris there after a flood.

In the 1950s, Guyaux started accepting slag and plaster from Griffin. Piles of this debris are on the property today.

>
> **Carmen Kruger,**
> Florez Street resident

The study also said, "Colton and the surrounding areas receive 100 percent of its water supply from local ground water sources."

Local water supplies are also fed by the Santa Ana River, which runs through the same property.

The nearest drinking water well operated by Colton is about one mile south of the Guyaux land and was closed before the 1993 study because of carcinogens found in the water.

Tetrachloroethylene and trichloroethylene found in the water are both used as industrial degreasers and are most often found in ground water because of spills at industrial facilities, said Bruin, of the EPA.

Animals exposed to these toxins have developed kidney damage and cancer and people exposed to the chemicals may get headaches, she said.

In May 1981, the Regional Water Quality Control Board asked Guyaux to test piles of black slag on his land; neighbors complained of black dust on their cars and in their homes.

In December 1981, he told the agency that the report on those tests was either lost or had never been done. Requests by the water quality control board for monitoring of the property in 1985 and 1988 were not answered.

Guyaux told Weston Co. interviewers that by 1985 he stopped accepting waste and alleged that unknown people continued to dump without his approval.

County officials say that despite whether Guyaux approved the of the dumping he can still be held liable for the waste on the land.

HISTORY OF THE SITE

History of the land based on aerial photographs from 1938 to 1991.

■ **1938** — The residential area north of the site has only a few houses and farmland around them. The bank of the Santa Ana River is at the end of Fernando and Florez streets and flows through the north end of the property. The city of Colton dumps construction debris from the rebuilding of the city after a flood. No other dumping or filling apparent on the site.

■ **1955** — Residential area to the north of the property has been developed. The river continues to flow through the north end of the property. The property is uses as a storage yard. Bricks and other materials brought to the site are cleaned and resold. Other contractors brought steel and wood to be sorted and resold. This operation continues through the mid-1980s. No other apparent dumping or filling on site.

■ **1969** — An active salvage area measures about 350 feet by 250 feet and is above the level of the river bed (likely filled in). The river flow has been altered and runs 1,500 feet south of dump site instead of former location at the end of Fernando and Florez streets.

■ **1978** — Vehicles are now parked on the salvage site. Filled area is now 500 feet by 400 feet. Light colored waste matter is visible around perimeter of filled area (possibly Crane Co. wastes). No dark piles of waste are visible in photo.

■ **1986** — Site appears same as today (when report was compiled in 1993). Salvage area inactive and filled area measures about 600 feet by 400 feet. Santa Ana River is about 1,500 feet south of the filled area. Dark waste piles visible east and west of the filled area.

■ **1991** — 'Site appears the same as in 1986 photograph.'

EVALUATION OF GROUNDWATER QUALITY DATA ASSOCIATED WITH GUYAUX LANDFILL (LOCATED AT THE END OF FLOREZ STREET IN THE CITY OF COLTON)

Dear Ms. Kruger:

Earlier this year we reviewed groundwater quality data contained in "Technical Memorandum No. 2B, SAWPA RIX Demonstration Project," dated December 21, 1989. Based on analytical data of VOCs, metals and general minerals obtained from sampling upgradient and downgradient wells, it does not appear that the Guyaux Landfill was having any notable effect on groundwater quality as of 1989. We believe, based on the long time period over which wastes were deposited into this landfill, that if a groundwater impact was going to occur, it would have manifested itself in some way by the time of the RIX investigation.

Several years ago, at the time of the RIX study, we requested that the monitoring wells be left open, to allow ongoing monitoring of groundwater in the vicinity of the site. The project proponent, however, opted to abandon the critical downgradient well, precluding us from obtaining ongoing data about changes in groundwater quality over time (i.e. after 1989).

If you have any questions regarding this letter, please call me at (909) 782-4381.

Sincerely,

William Norton

SAN BERNARDINO
CO., CALIF.

AFFIDAVIT TERMINATING JOINT TENANCY

STATE OF CALIFORNIA)
) SS.
COUNTY OF SAN BERNARDINO)

RUTH M. ZANDBERGEN, of legal age, being first duly sworn, deposes and says:

(1) That Affiant RUTH M. ZANDBERGEN is named as one of the grantees in that certain deed recorded April 2, 1987, as Instrument #87-107991 of Official Records in the Office of the County Recorder of San Bernardino County, California, conveying real property hereinafter described as Parcel "A".

(2) That Affiant RUTH M. ZANDBERGEN is named as one of the grantees in that certain deed recorded March 11, 1986, as Instrument #86-063087 of Official Records in the Office of the County Recorder of San Bernardino County, California, conveying real property hereinafter described as "Parcel "B".

(3) That ROBERT ZANDBERGEN, Grantee and Joint Tenant in both of the above-mentioned deeds, died on August 15, 1991, and is the same person named as the decedent in the certified copy of Certificate of Death, Records of San Bernardino County, California, attached hereto as Exhibit "A".

(4) By reason of the death of ROBERT ZANDBERGEN, one of the above-named grantees, all of his right, title and interest as Joint Tenant in and to the real properties herein described thereupon terminated.

The property described in said deeds is described as follows:

PARCEL A:

Portion of Lots 2 and 3, Block 80, RANCHO SAN BERNARDINO, in the City of Colton, County of San Bernardino, State of California, as per map recorded in book 7, page 2 of Maps, in the office of the county recorder of said county, described as follows:
COMMENCING at the southeast corner of Lot 57, RAMONA SUBDIVISION, TRACT NO. 2270; thence South 773.8 feet; thence South 35°47' West 163.7 feet; thence South 48°52' West 171.2 feet, more or less, to the west line of said Lot 2; thence South to a point 100 feet north of the southwest corner of said Lot 2; thence West to the west line of the east half of the east half of said Lot 3; thence North to the southwest corner of Ramona Subdivision; thence East 185.67 feet; thence North 90 feet; thence East 135.67 feet; thence North 135 feet; thence East 175.67 feet; thence North 90 feet; thence East 138.56 feet to the point of beginning.

(Assessor's Parcel No. 0163362120000)

PARCEL B:

Residence at 22638 Main Street, Grand Terrace, County of San Bernardino, State of California, more particularly described as:

Lot 38, TRACT NO. 9170, as per plat recorded in Book 127 of Maps, pages 87 and 88, and Amended Map recorded in Book 128 of Maps, pages 69 and 70, records of said County.

(Assessor's Parcel No. 0277464280000)

DATED:

State of California
County of San Bernardino

Ruth M. Zandbergen
Ruth M. Zandbergen

SUBSCRIBED AND SWORN to before me, the undersigned, a Notary Public in and for the said County and State, this 1st day of November, 1991.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

Mr. Ralph Guyuax
16955 Washington Street
Riverside, CA 92504

Re: Guyuax Landfill
CAD 983652033

Dear Mr. Guyuax:

Enclosed find the report of a recent evaluation of the Guyuax Landfill conducted by the U.S. Environmental Protection Agency. This evaluation was conducted under the authority of Section 104 of the Comprehensive Environmental Response, Compensation, and Liability Act, as amended, 40 U.S.C. § 9604, commonly known as Superfund.

The results of our groundwater sampling show that concentrations of hazardous substances detected in the groundwater wells downgradient of the landfill were not significantly (more than three times) greater than what was found in groundwater wells upgradient from the landfill. For this reason, this site does not qualify for listing on the federal Superfund [National Priorities] List. However, the results of our soil sampling indicate that hazardous substances including arsenic, cadmium, chromium, lead, manganese, mercury and toluene are present at concentrations significantly above background levels. Since the landfill is not secured from public access and the soil is uncovered, there is a potential of exposing the public to the contaminants.

We have discussed the conditions at the landfill with California Department of Toxic Substances Control. They will be the lead regulatory agency for you to work with as you further investigate the hazardous conditions at the landfill. Upon the request of DTSC, we will provide technical assistance in selecting options for investigating and remediating the landfill.

An EPA Region IX remedial site assessment decision record is included at the end of the report.

Please forward any written comments to:

Gordon Woodrow [H-8-1]
U. S. Environmental Protection Agency

Date: August 14, 1996

Prepared by: Gregory R. Carroll

Review and Concurrence: Michele Dermer

Bechtel Environmental, Inc.

1.0 INTRODUCTION

The U.S. Environmental Protection Agency (EPA), Region IX, under the authority of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and the Superfund Amendments and Reauthorization Act of 1986 (SARA), has tasked Bechtel Environmental, Inc. (BEI) to conduct an expanded site inspection (ESI) of the Guyaux Landfill site in Colton, San Bernardino County, Calif.

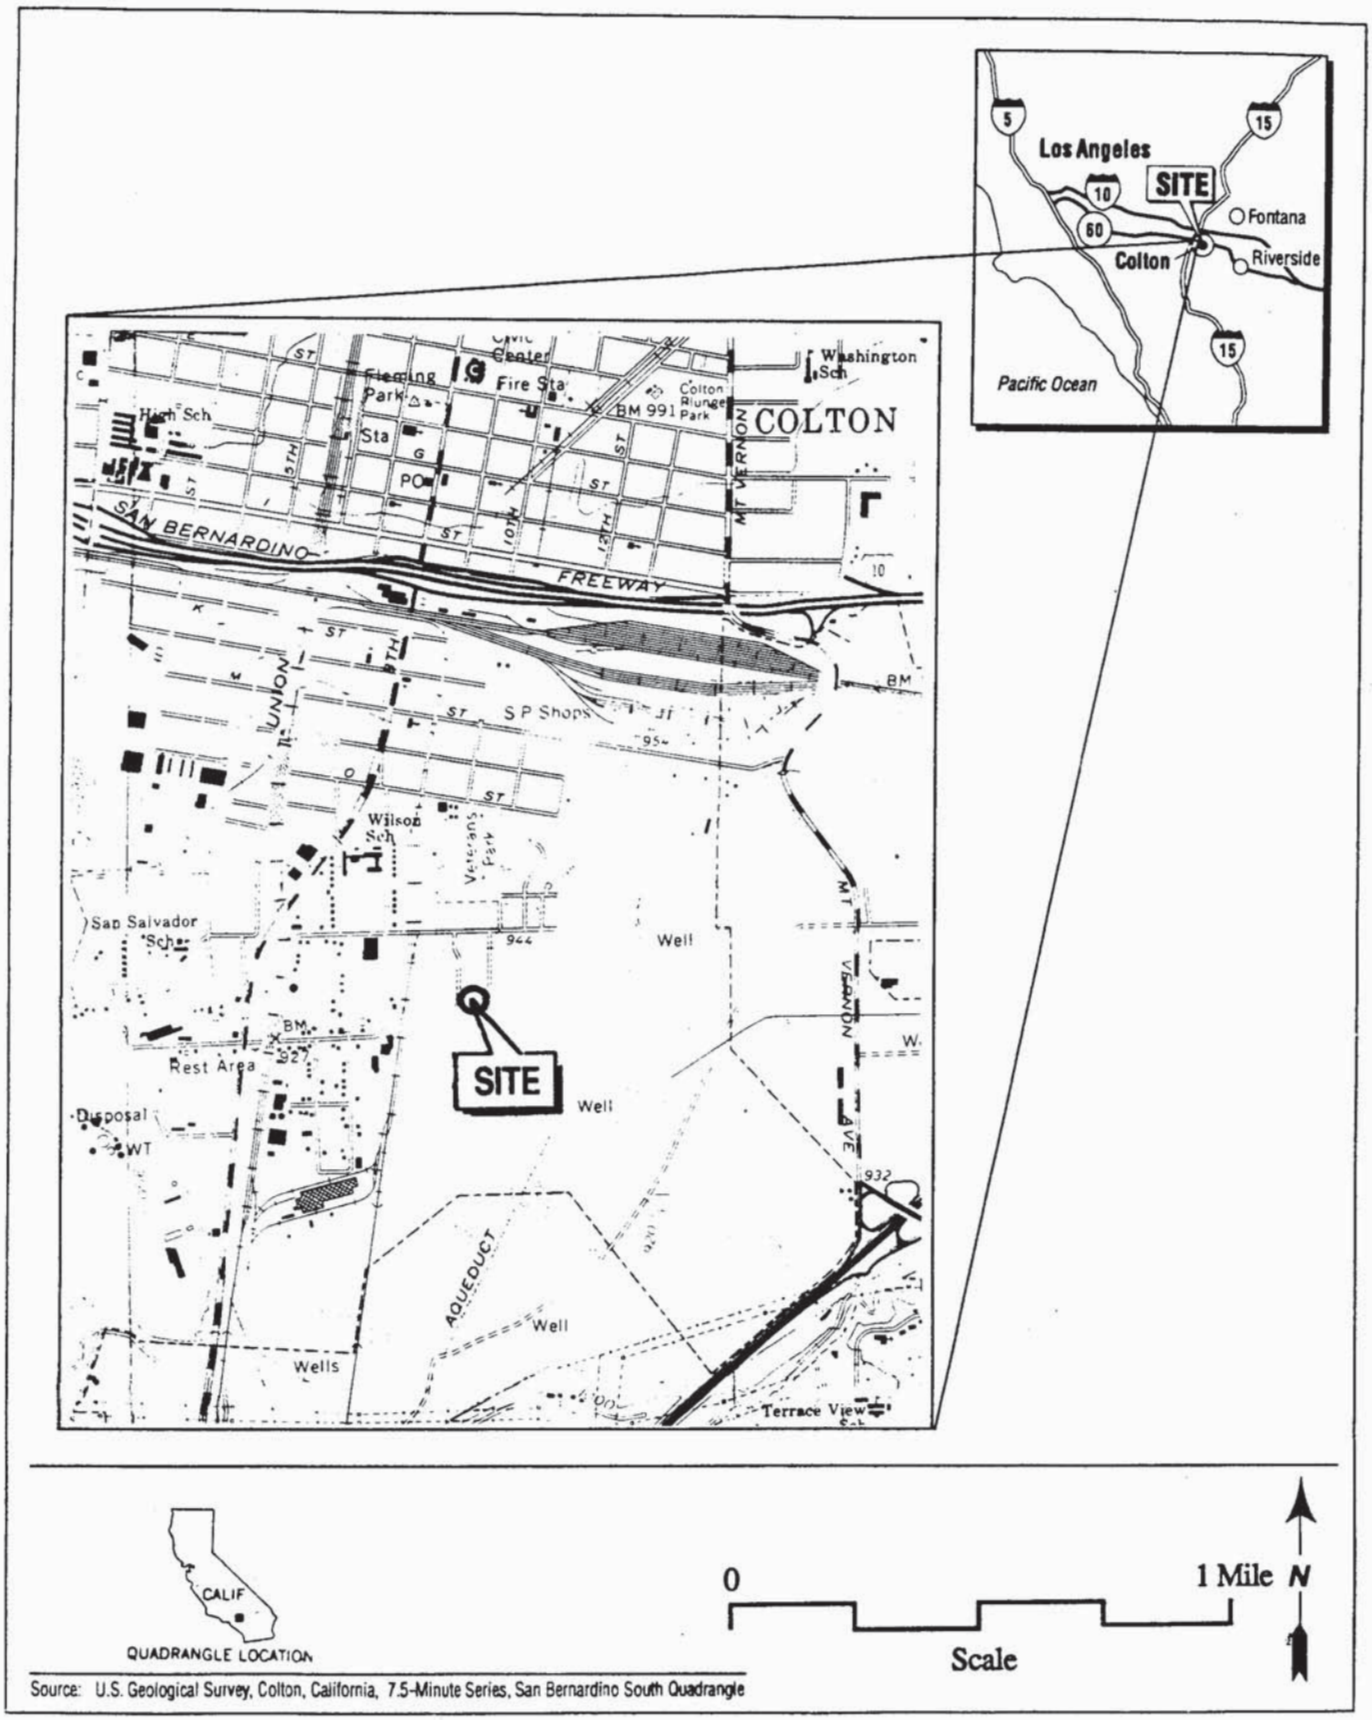
The Guyaux Landfill site (the site) was identified as a potential hazardous waste site and entered into the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) on November 9, 1992 (CAD 983652033) (1).

A preliminary assessment (PA) of the Guyaux Landfill site was conducted for the EPA by Roy F. Weston, Inc. on June 10, 1993. A site inspection (SI) of the Guyaux Landfill site was conducted for the EPA by BEI on June 14, 1995. The purpose of the PA and SI was to review existing information on the site and its environs to assess the threat(s), if any, posed to public health, welfare, or the environment, and to determine if further action under CERCLA/SARA is warranted. (2,3)

After reviewing the PA and SI, the EPA decided that further investigation of the Guyaux Landfill site would be necessary to more completely evaluate the site using the EPA's Hazard Ranking System (HRS) criteria. The HRS assesses the relative threat associated with actual or potential releases of hazardous substances at the site. The HRS has been adopted by the EPA to help set priorities for further evaluation and eventual remedial action at hazardous waste sites. The HRS is the primary method of determining a site's eligibility for placement on the National Priorities List (NPL). The NPL identifies sites at which the EPA may conduct remedial response actions. This report summarizes the results of the ESI of the Guyaux Landfill site.

1.1 Apparent Problem

The apparent problems at the site are:



- In the 1970s and 1980s, waste slag generated at the Griffin Wheel Company, a nearby foundry, was disposed of at the Guyaux Landfill (7). Results of laboratory analyses of the waste slag samples from the Griffin Wheel Company property indicated the presence of hazardous substances, including arsenic, cadmium, and lead, at concentrations three times greater than background levels. (4,5)

2.0 SITE DESCRIPTION

2.1 Location

The Guyaux Landfill site is located at the end of Flores and Fernando streets in Colton, San Bernardino County, Calif. The geographic coordinates for the site are 34° 03' 11.50" N latitude, 117° 19' 15.50" W longitude (Township 1 South, Range 4 West, San Bernardino Baseline and Meridian, San Bernardino South, Calif., 7.5-minute quadrangle) (6). The location of the site is shown in Figure 2-1.

Printed on 50% recycled paper

Source: U.S. Geological Survey, Colton, California, 7.5-Minute Series, San Bernardino South Quadrangle

Figure 2-1 Site Location

2.2 Site Description

The Guyaux Landfill site is located in a mixed industrial and residential area of Colton, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by vacant land and the Santa Ana River. The site layout is shown in Figure 2-2. The site occupies 28 acres of undeveloped land: a 4-acre portion in the northern part was used as a landfill from 1930 until 1994 and is approximately 15 feet higher than the rest of the site, which lies in the Santa Ana River floodplain. The entire site is unpaved. At the time of the January 1995 BEI site reconnaissance, the site was not fenced and was covered with vegetation. The landfill portion of the site was graded later in 1995, and the vegetation cleared. Currently, a fence separates the site from adjoining streets and residences, preventing vehicular access to the site. However, the fence does not entirely enclose the site. Except for the fence, there are no structures on site. (7,8)

2.3 Operational History

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994, when Ralph Guyaux acquired the title. (5)

Since 1930, approximately 4 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton was disposed of in the landfill portion of the site. In the 1950s, the landfill was used for the temporary storage of bricks and other construction materials prior to their reuse. In the 1970s and 1980s, the landfill was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company sites. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited in the landfill. In addition, the landfill accepted waste foundry slag from the Griffin Wheel Company (7). Since 1985, the landfill portion of the site has been used for the temporary storage of cars and machinery prior to their dismantling and reuse. (7) At the time of the March 1996 BEI field sample event, no cars or machinery was observed on site (8).

At the time of the January 1995 BEI site reconnaissance, piles of waste slag were noted along the face and on top of the landfill. Several piles of used tires and pieces of old furniture were also visible on site. In addition, up to ten 55-gallon drums that appeared to be empty were observed on site. (7) At the time of the March 1996 BEI field sample event, the landfill had been graded so that the top was relatively flat. Dark foundry slag was visible on the land surface. Two partially buried drums were visible along the south and east margins of the landfill. The contents of the drums, if any, are unknown. There is no evidence of any liner or containment structure on site. (8)

2.4 Regulatory Involvement

2.4.1 U.S. Environmental Protection Agency (EPA). The Guyaux Landfill site is not listed in the Resource Conservation and Recovery Information System (RCRIS) database, as of August 25, 1995 (9).

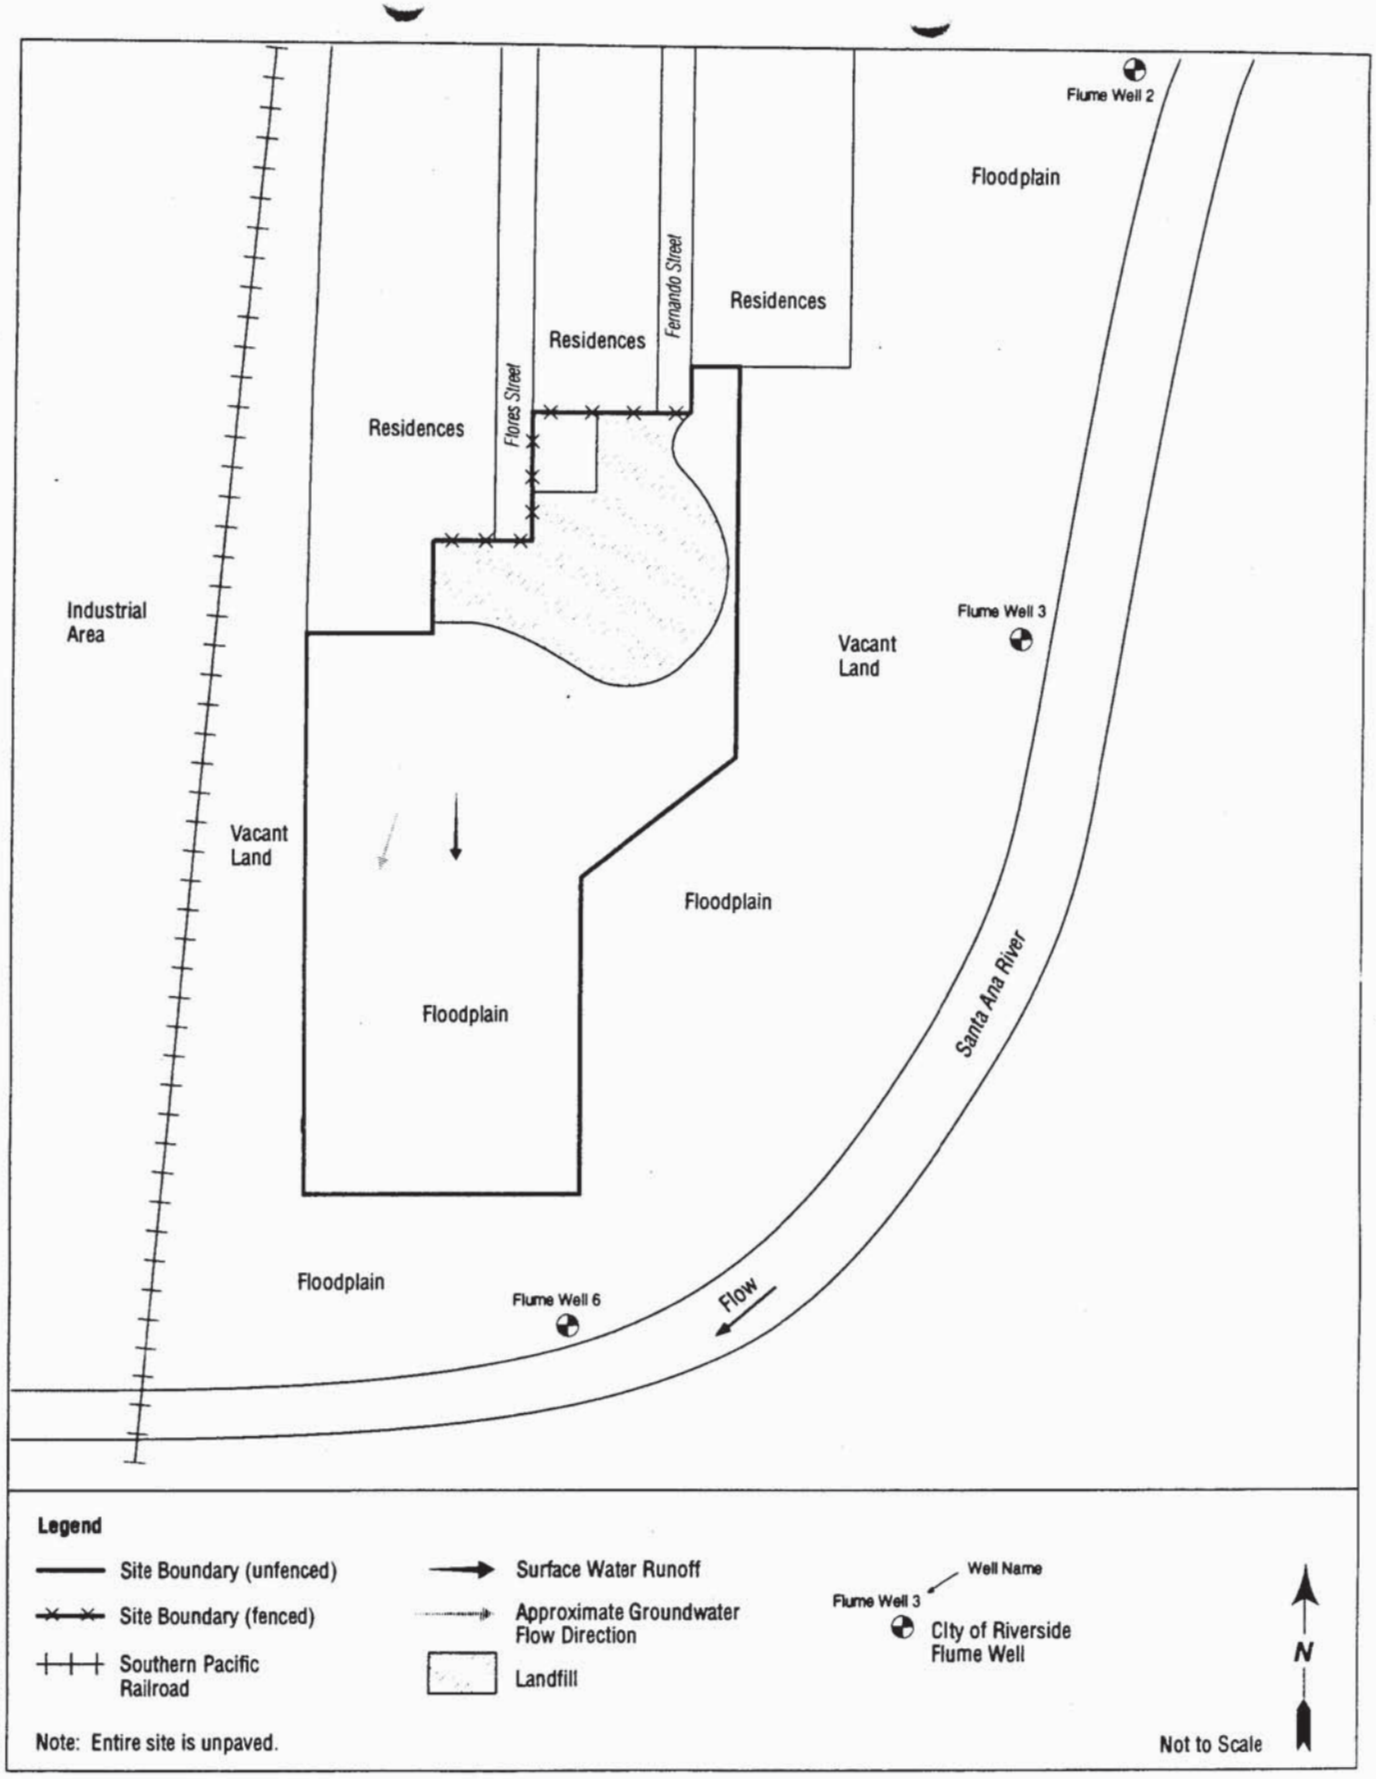


Figure 2-2 Site Layout

2.4.2 California Environmental Protection Agency.

Regional Water Quality Control Board (RWQCB), Santa Ana Region. The RWQCB has been involved with the site since 1977. In response to a citizen's complaint in 1977, the RWQCB requested that the site owner submit a report of waste discharge. In response, the site owner submitted an incomplete report of waste discharge to the RWQCB. In 1981, the RWQCB requested that the site owner sample and analyze the waste slag. The site owner did not comply with this request. In 1985, the RWQCB requested that the site owner install a groundwater monitoring network around the site. The site owner did not comply with this request. In 1988, the RWQCB requested that the site owner perform a Solid Waste Assessment Test (SWAT). The site owner did not respond to this request. (5) In May 1996, a RWQCB representative conducted a site visit with a representative of the EPA Region IX (10).

2.4.3 San Bernardino County Fire Department, Hazardous Materials Division (HMD). According to an HMD representative, the HMD is not involved with the site (11).

2.4.4 San Bernardino County, Public Health Department, Division of Environmental Health (DEH). According to a DEH representative, the DEH has referred the site to the RWQCB and is not currently involved with the site (12).

2.4.5 City of Colton, Community Development Department (CDD). In 1995, the CDD found the site owner in violation of city property maintenance codes and issued a citation for non-compliance. The City of Colton obtained a court order directing the site owner to remove debris (e.g., tires, scrap metal, concrete, weeds) from the site. In 1995, the site owner complied with the court order, removing debris and weeds from the site and taking them to a municipal landfill. According to the CDD, its authority covers only aesthetics, not environmental issues. (13)

3.0 INVESTIGATIVE EFFORTS

3.1 Previous Sampling and Analyses

3.1.1 Waste Slag Sampling. Waste slag generated at the Griffin Wheel Company was deposited at the Guyaux Landfill site (7). In 1989, as part of its Phase II environmental site assessment of the Griffin Wheel Company property, Dames & Moore, contractors to the Griffin Wheel Company, characterized the waste slag. Eleven soil borings were drilled in an onsite slag pile during this investigation. The slag samples were analyzed for California Code of Regulations Title 22 metals. Analytical results of laboratory analyses of the samples indicated the presence of metals, including concentrations up to 105 milligrams per kilogram (mg/kg) of arsenic, 72.1 mg/kg of cadmium, and 9,520 mg/kg of lead. (4)

3.1.2 Groundwater Sampling. In 1989, the Santa Ana Watershed Project Authority (SAWPA) conducted a regional hydrogeological study in the vicinity of the site. As part of this study, three monitoring wells were installed. These wells were screened in a shallow, locally perched groundwater zone, approximately 40 to 80 feet below ground surface (bgs). Well MW-4B was installed approximately 0.2 mile upgradient of the site; Well MW-5 was installed less than 0.1 mile cross-gradient of the site; and Well A-2 was installed on site less than 0.1 mile downgradient of the body of the landfill. Groundwater samples collected from the three monitoring wells were analyzed for VOCs and metals. Information on the analytical methods used is not available. (14)

Results of laboratory analyses indicate the presence of tetrachloroethene (PCE) and trichloroethene (TCE) in the downgradient well at concentrations of 17 micrograms per liter (µg/l) and 2 µg/l, respectively. Arsenic and manganese were detected at concentrations of 18

µg/l and 42 µg/l, respectively, in the groundwater sample collected from the downgradient well. PCE was detected at a concentration of 7 µg/l in the cross-gradient well. No other hazardous substances were detected in the groundwater sample collected from the cross-gradient well. PCE was detected at a concentration of 12 µg/l in the upgradient well. No other hazardous substances were detected in the groundwater sample collected from the upgradient well. (14) According to SAWPA's consultant for the study, the monitoring wells were destroyed following the groundwater study (15).

In 1993, 1994, and 1995, the City of Riverside collected groundwater samples from one or more of the following agricultural wells in the vicinity of the site: Flume Well 2 (approximately 0.3 mile upgradient of the site), Flume Well 3 (approximately 0.2 mile cross-gradient of the site), and Flume Well 6 (approximately 0.4 mile downgradient of the site). (16,17)

In November 1993, Truesdail Laboratories, Inc. analyzed a groundwater sample collected from Flume Well 2 using Standard Method 3500 As-B. Analytical results indicated the presence of arsenic at a concentration of 15 µg/l in the groundwater sample. (16,17)

In August 1994, Del Mar Analytical Laboratories, Inc. analyzed groundwater samples collected from Flume Wells 2 and 6 using EPA Method 7060. Arsenic was not detected above the detection limit of 2.0 µg/l in the groundwater sample collected from Flume Well 2. Analytical results indicated the presence of arsenic at a concentration of 11 µg/l in the groundwater sample collected from Flume Well 6. (16,17)

In October 1994, Del Mar Analytical Laboratories, Inc. analyzed groundwater samples collected from Flume Wells 2, 3, and 6 using EPA Method 7060. Analytical results indicated the presence of arsenic at concentrations of 8.3 µg/l, 11 µg/l, and 9 µg/l in the groundwater samples collected from Flume Wells 2, 3, and 6, respectively. (16,17)

In August 1995, Del Mar Analytical Laboratories, Inc. analyzed groundwater samples collected from Flume Wells 2, 3, and 6 using EPA Method 7060. Analytical results indicated the presence of arsenic at concentrations of 4 µg/l, 8.8 µg/l, and 11 µg/l in the groundwater samples collected from Flume Wells 2, 3, and 6, respectively. Chromium, lead, and mercury were not detected in any of the groundwater samples collected from the three flume wells during the above-mentioned City of Riverside sampling events. Manganese was not detected in any of the groundwater samples collected from the three flume wells during the above-mentioned City of Riverside sampling events except as follows: 45 µg/l in Flume Well 2 in November 1993, 630 µg/l in Flume Well 6 in August 1994, 110 µg/l in Flume Well 2 in August 1995, 390 µg/l in Flume Well 3 in August 1995, and 180 µg/l in Flume Well 6 in August 1995. (16,17)

3.2 EPA Sampling

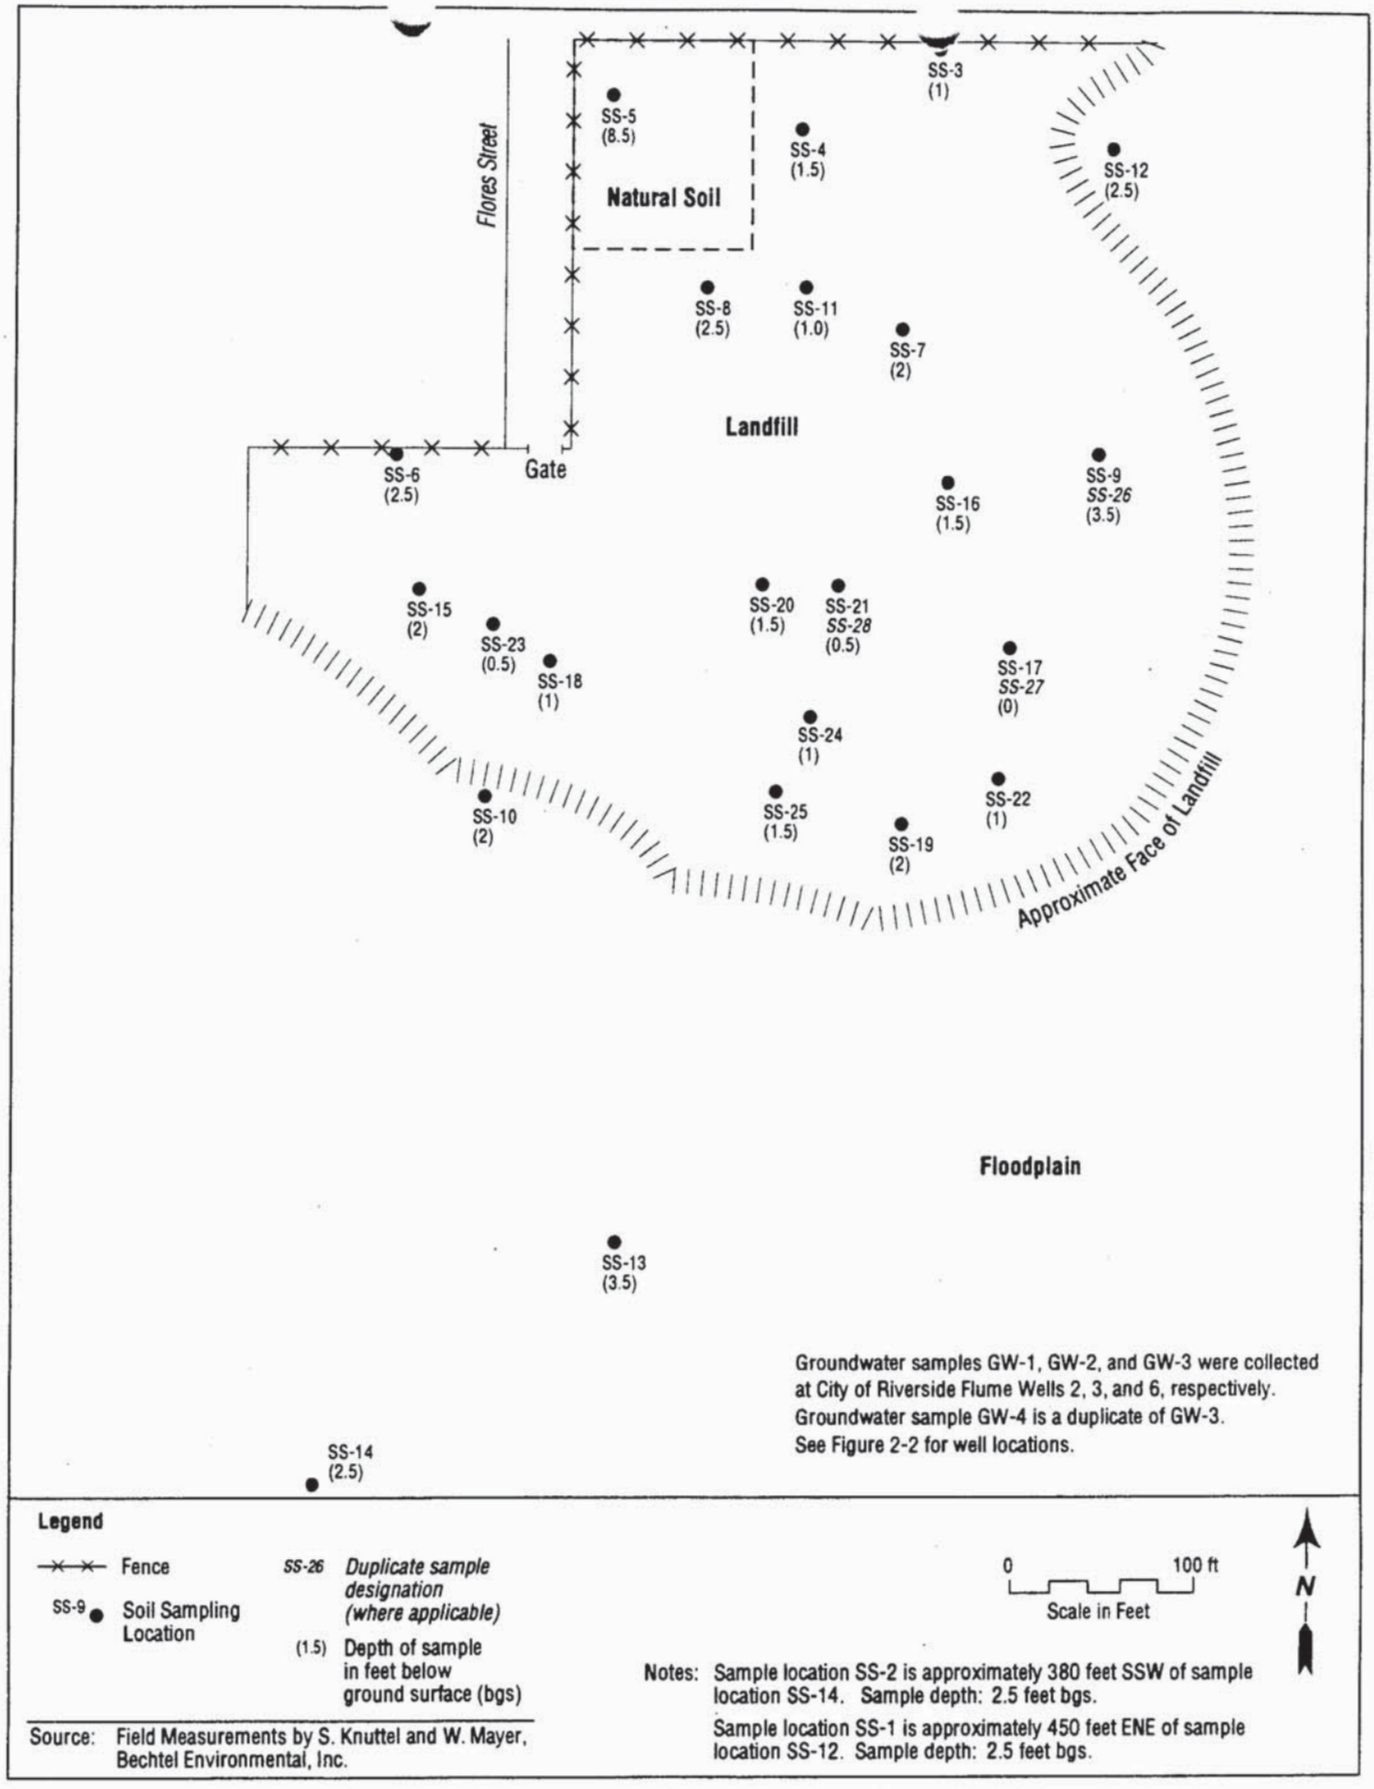
From March 11 to 13, 1996, BEI, under the direction of the EPA, conducted a sampling event at the Guyaux site. BEI collected soil and groundwater samples in accordance with the protocol described in the field sample plan (see Appendix E). There were no deviations from the sampling plan for groundwater sampling. There were two deviations from the field sample plan for the soil sampling:

- Many soil sampling locations differed from those specified in the field sample plan because the landfill had been graded prior to the sampling event. As a result, the locations of slag and other landfill materials were determined at the time of sampling.

- All soil samples collected from the landfill were collected at depths of 0 to 3.5 feet bgs, rather than 0 to 10 feet bgs, as specified in the field sample plan. Deeper soil samples could not be collected due to auger refusal. However, since slag was visible on the land surface, it was possible to collect soil samples containing slag, even at these shallower depths.

Twenty-eight soil samples (including three duplicates) were collected from 25 surface and subsurface locations. Four groundwater samples (including one duplicate) were collected from three nearby irrigation wells owned and operated by the City of Riverside. All soil and groundwater samples were analyzed using the Contract Laboratory Program Analytical Services (CLPAS) for total metals and for volatile organic compounds. The CLPAS total metals analysis included analysis for arsenic, lead, selenium, and thallium using EPA Method 200.7. In addition, the EPA Region IX Laboratory in Richmond, Calif., analyzed the groundwater samples for low-level arsenic and low-level volatile organic compounds under the Regional Analytical Program (RAP). The EPA Quality Assurance Management Section (QAMS) validated the analytical results for all samples collected during this sampling event.

Figure 3-1 shows soil and groundwater sampling locations.



3.2.1 Soil Sampling. Analytical results indicate the presence of metals in onsite soil samples at the following concentrations: up to 39.9 mg/kg of arsenic, up to 313 mg/kg of barium, up to 25.2 mg/kg of cadmium, up to 383 mg/kg of chromium, up to 20.7 mg/kg of cobalt, up to 548 mg/kg of copper, up to 5,600 mg/kg of lead, up to 16,500 mg/kg of manganese, up to 1.1 mg/kg of mercury, up to 1.7 mg/kg of selenium, up to 22.7 mg/kg of silver, up to 66.3 mg/kg of vanadium, and up to 4,860 mg/kg of zinc.

Analytical results indicate the presence of metals in offsite (background) soil samples at the following concentrations: 7.6 mg/kg of chromium, up to 16.1 mg/kg of copper, up to 66.4 mg/kg of lead, up to 121 mg/kg of manganese, 0.48 mg/kg of silver, up to 15.0 mg/kg of vanadium, and up to 60.0 mg/kg of zinc. Arsenic, barium, beryllium, cadmium, cobalt, mercury, and selenium were not detected above the contract required detection limit (CRDL) in any of the background soil samples.

Analytical results of CLPAS volatile organic analyses indicate the presence of toluene in onsite soil samples at concentrations up to 150 µg/kg. Toluene was detected in one offsite (background) soil sample at a concentration of 38 µg/kg. No other analytes were detected above the reported sample quantitation limit.

3.2.2 Groundwater Sampling. Results of CLPAS total metals analyses indicate the presence of arsenic in City of Riverside flume wells at the following concentrations: 11.7 µg/l in Flume Well 2, 12.5 µg/l in Flume Well 3, and up to 13.9 µg/l in Flume Well 6. Results of RAP analyses for low-level arsenic indicate the presence of arsenic at the following concentrations: 7.3 µg/l in Flume Well 2, 12.5 µg/l in Flume Well 3, and up to 12.5 µg/l in Flume Well 6. The QAMS qualified the RAP analytical result for Flume Well 2 (7.3 µg/l of arsenic) as "qualitatively acceptable, but quantitatively unreliable due to high uncertainty in the analytical precision near the limit of detection." (Appendix F)

Results of CLPAS total metals analyses indicate that barium, beryllium, cadmium, chromium, cobalt, copper, manganese, selenium, silver, vanadium, and zinc were not detected above the contract required detection limit (CRDL) in any of the groundwater samples. Unqualified results for lead and mercury in groundwater were not available due to the presence of these metals in the equipment blank sample. (Appendix F)

arcs 95-06230.004

Figure 3-1 Soil and Groundwater Sampling Locations

Results of RAP low-level volatile organic compound analyses indicate that no analyte was detected above the contract required detection limit (CRDL) in any of the groundwater samples. (Appendix F)

See Appendix F for the complete results of the March 1996 EPA sampling event.

4.0 HAZARD RANKING SYSTEM FACTORS

4.1 Sources of Contamination

The following potential hazardous substance sources are associated with the site:

- Soil containing hazardous substances: Analytical results of soil samples collected from the landfill area on site during the 1996 BEI field sampling event indicate the presence of metals, including arsenic, chromium, lead, manganese, and mercury, at concentrations greater than three times background levels. (Appendix F)
- Two drums were observed on site during the 1996 BEI field sampling event. The contents of these drums, if any, are unknown. (8)

4.2 Groundwater Pathway

*4.2.1 **Hydrogeological Setting**.* The San Bernardino Valley/Upper Santa Ana Valley area is an alluvial plain, bounded on the northwest by the San Gabriel Mountains, on the northeast and east by the San Bernardino Mountains, on the southeast by the San Timoteo Badlands, and on the south by the Box Springs Mountains and the Jurupa Mountains. To the west, the area is bordered by the northern Santa Ana Mountains and the San Gabriel Valley. (4)

The south and east portions of the Guyaux Landfill site occupy part of the Santa Ana River floodplain. The landfill portion of the site is an extension of the terrace that forms the west bank of the floodplain. (8) Municipal drinking water wells in the vicinity of the site pump groundwater from depths ranging from 150 to 800 feet bgs (18). The depth to groundwater measured in City of Riverside flume wells within 0.4 mile from the site was between 19 and 20 feet bgs during the 1996 BEI field sample event (19). Groundwater flow direction in the vicinity of the site is to the south to southwest (14). Natural soils in the vicinity of the site are floodplain deposits consisting primarily of sand and gravel (20). Logs of soil borings drilled into the Santa Ana River floodplain on and near the site indicate the absence of regionally extensive silt and clay layers. The boring logs indicate interconnection between the shallow aquifer and the drinking water aquifer. (14)

*4.2.2 **Groundwater Targets**.* Seventy-two drinking water wells within 4 miles of the site contribute to four municipal drinking water systems that serve approximately 285,000 people. The nearest drinking water well is approximately 0.4 mile southeast of the site. No hazardous substances attributable to the site have been detected in any of the drinking water wells. (21,22,23,24,25,26,27)

The City of Riverside obtains 99 percent of its municipal drinking water supply from a blended system of 48 active water wells, 32 of which are within 4 miles of the site. The Metropolitan Water District supplies the remaining 1 percent through a single surface water connection. The entire system serves approximately 242,000 persons. (21,26,28)

The City of Colton obtains 100 percent of its municipal drinking water supply from a blended system of 14 active water wells, all of which are within 4 miles of the site. The entire system serves approximately 8,720 connections. There are approximately 3.1 persons per household in the City of Colton. Therefore, the system serves approximately 27,032 persons. (22,27)

The Riverside Highland Water Company obtains 100 percent of its municipal drinking water supply from a blended system of eight active water wells, four of which are within 4 miles of the site. The entire system serves approximately 14,000 persons. (23,24,28)

The Terrace Water Company obtains 100 percent of its municipal drinking water supply from a blended system of two active water wells, both of which are within 4 miles of the site. Each well contributes equally to the system. The entire system serves approximately 540 connections. Based on an approximate population multiplier of 3.1 persons per household, the system serves approximately 1,674 persons. (25,27)

*4.2.3 **Groundwater Pathway Conclusion.*** There appears to be a potential for a release of hazardous substances from the site to groundwater. Natural soils in the vicinity of the site are floodplain deposits consisting primarily of sand and gravel. Groundwater beneath the southern portion of the site (i.e., the Santa Ana River floodplain) occurs at a depth of approximately 19 to 20 feet bgs, and flows toward the south-southwest. Shallow soil boring logs indicate that the shallow aquifer is interconnected with the drinking water aquifer. Seventy-two drinking water wells within 4 miles of the site contribute to four municipal drinking water systems that serve approximately 285,000 people. No hazardous substances attributable to the site have been detected in any of the drinking water wells.

Analytical results indicate the presence of arsenic in groundwater samples collected from monitoring wells and irrigation wells near the site from 1989 through 1995. Arsenic concentrations up to 8.3 µg/l have been detected upgradient of the site. Arsenic concentrations up to 18 µg/l have been detected downgradient of the site. Analytical results of groundwater samples collected from three irrigation wells during the BEI 1996 sampling event did not indicate the presence of arsenic at concentrations greater than or equal to three times background levels. The analytical results indicated the presence of arsenic at concentrations up to 11.7 µg/l in the upgradient well and up to 13.9 µg/l in the downgradient well.

4.3 Surface Water Pathway

Surface water runoff from the site enters the Santa Ana River, an intermittent stream that flows southwest into the Pacific Ocean, approximately 40 miles from the site (7). There are no drinking water intakes within 15 miles downstream of the site. Potential impacts of the site on downstream fisheries and sensitive environments appear to be minimal. (29)

4.4 Soil Exposure and Air Pathway

The site is undeveloped land that occupies part of the Santa Ana River floodplain and the western edge of the floodplain. The site is sparsely vegetated and consists entirely of exposed soil. Slag is visible on the land surface of the landfill area, which occupies approximately 4 acres of the 28-acre site. A fence separates the site from adjoining streets and residences, preventing vehicular access to the site. However, the fence does not entirely enclose the site. Although residences bordering the site are within 200 feet of hazardous substances sources on site, there are no residences on site, and there are no schools or daycare centers on or within 200 feet of hazardous substance sources on site. (8)

5.0 EMERGENCY RESPONSE CONSIDERATIONS

The National Contingency Plan [40 CFR 300.415 (b) (2)] authorizes the EPA to consider emergency response actions at sites that pose an imminent threat to human health or the environment. For the following reasons, a referral to Region IX's Emergency Response Section does not appear to be necessary:

- There are no residences, schools, or daycare centers on site. (7,8)
- No hazardous substances attributable to the site have been detected in nearby irrigation wells or drinking water wells. (21,22,23,25)

6.0 SUMMARY

The Guyaux Landfill site occupies 28 acres of undeveloped land at the end of Flores and Fernando streets in a mixed industrial and residential area of Colton, San Bernardino County, Calif. A 4-acre portion in the northern part of the site was used as a landfill from 1930 until 1994 and is approximately 15 feet higher than the rest of the site, which lies in the Santa Ana River floodplain. A fence separates the site from adjoining streets and residences, preventing vehicular access to the site. There are no other structures on site.

In the 1970s and 1980s, the landfill was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company sites. Materials disposed of on site include construction debris, plaster molds, broken porcelain, and waste foundry slag. These materials apparently were disposed of on exposed soil.

In response to a citizen complaint in 1977, the California Regional Water Quality Control Board (RWQCB), Santa Ana Region requested that the site owner submit a report of waste discharge. In response, the site owner submitted an incomplete report of waste discharge to the RWQCB. During the 1980s, the RWQCB requested that the site owner sample and analyze waste slag on site, install a groundwater monitoring network around the site, and perform a Solid Waste Assessment Test. The site owner has not responded to these requests. The San Bernardino County Fire Department, Hazardous Materials Division and the San Bernardino County, Public Health Department, Division of Environmental Health are not currently involved with the site.

In March 1996, Bechtel Environmental, Inc., on behalf of the EPA, collected soil samples on site. Analytical results indicate the presence of hazardous substances, including arsenic, cadmium, chromium, lead, manganese, mercury, and toluene, in the onsite soil samples at concentrations three times above background levels. During the same sampling event, groundwater samples were collected from three irrigation wells within 0.4 mile of the site. No hazardous substances were detected in the downgradient well at concentrations three times above those detected in the cross-gradient well or the upgradient well.

The shallow aquifer occurs at a depth of approximately 19 to 20 feet below ground surface and is interconnected with a deeper aquifer that is used as a drinking water supply. Seventy-two drinking water wells within 4 miles of the site contribute to four municipal drinking water systems that serve approximately 285,000 people. Surface water runoff from the site enters the Santa Ana River, an intermittent stream that flows southwest into the Pacific Ocean, approximately 40 miles from the site. The site is sparsely vegetated and consists entirely of exposed soil. Slag is visible on the land surface of the landfill area.

The following pertinent Hazard Ranking System factors are associated with the site:

- Although a potential exists for hazardous substances to be released from the site to groundwater, no hazardous substances attributable to the site have been detected in any nearby drinking water wells.

- There are no drinking water intakes within 15 miles downstream of the site.
- There are no residences on site, and there are no schools or daycare centers on or within 200 feet of hazardous substance sources on site.

REMEDIAL SITE ASSESSMENT DECISION - EPA REGION IX

Site Name: Guyaux Landfill **EPA ID#:** CAD 983652033

Alias Site Names:

City: Colton **County or Parish:** San Bernardino **State:** CA

Refer to Report Dated: 8/14/96 **Report type:** ESI Report

Report developed by: Bechtel Environmental, Inc.

DECISION:

N **1. Further Remedial Site Assessment under CERCLA (Superfund) is not required because:**

N **1a.** Site does not qualify for further remedial site assessment under CERCLA (Site Evaluation Accomplished - SEA)

| | **1b.** Site may qualify for further action, but is deferred to: | | RCRA | | NRC

| | **2. Further Assessment Needed Under CERCLA:** **2a.** (optional) Priority: | | Higher | | Lower

2b. Activity Type: | | PA | | SI | | ESI | | HRS evaluation

| | Other:

DISCUSSION/RATIONALE:

Groundwater sampling did not indicate significant levels of contaminants. However, soil sampling indicate numerous contaminants significantly above background samples. Since the landfill is not secluse from public access and the soil is uncovered, there is a potential exposure of the public to soil contaminants.

EPA has referred this landfill site to DTSC as the lead regulatory agency and will assist DTSC as needed.

Report Reviewed, Approved, and Site Decision Made by: Gordon Woodrow **Signature:** Gordon Woodrow **Date:** 3/13/97

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Jack Rolwes	City of Riverside Water Operations	(909) 782-5312	10/31/95	The City of Riverside can make its flume wells available to BEI for sampling this winter. Purged groundwater can be discharged into irrigation canals or into the Santa Ana River, the usual practice of the City of Riverside. If the City of Riverside anticipates any problems in making the wells available, they will contact me as soon as possible.
Tish Baden	City of Colton, Community Development Department (CDD)	(909) 370-5079	11/1/95	Ms. Baden is the Code Enforcement Officer. The City of Colton CDD found the site owner in violation of city property maintenance codes and issued a citation for non-compliance. The city obtained a court order directing the site owner to remove debris (e.g., tires, scrap metal, concrete, weeds) from the site. The site owner complied with the court order, removing debris and weeds from the site to a municipal landfill. According to the CDD, its action covers only aesthetics, and not any environmental issues. No environmental sampling or testing is associated with this enforcement action.
Charlotte Guyaux	Site Owner	(909) 780-2818	12/13/95	Mrs. Guyaux was informed that BEI planned to sample at her property in January 1996. She gave verbal permission to collect samples, but asked that I call and give one week's notice before sampling.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

Site: Guyaux Landfill

Name	Affiliation	Phone	Date	Information
Patrick Hannifin	City of Riverside	(909) 351-6318	2/6/96	Arrangements were made to collect groundwater samples from City of Riverside flume wells during the week of March 11-15, 1996. Canals are currently down for maintenance, so sampling would not be possible now, but Mr. Hannifin expects that they will be available in March.
Charlotte Guyaux	Site Owner	(909) 780-2818	3/4/96	As Mrs. Guyaux previously requested, I gave site owners one week's notice for field sampling. We arranged to meet Monday, March 11, at the site at 7:30 AM. I need to bring my own lock and key to secure the site lock.
David Zamora	Community Development Department, City of Colton	(909) 370-5079	3/4/96	I notified Mr. Zamora of our plans to begin sampling on 3/11/96.
Doug Snyder	San Bernardino County Fire Department, Hazardous Materials Division	(909) 884-4056	5/28/96	The county environmental health department was split into two, with Mr. Snyder in Hazardous Materials Division as part of the Fire Department. The lead contact for Guyaux is Paul Tavares in the Division of Environmental Health (DEH), which is part of the county health department. Please send copies of the ESI report to both Mr. Snyder and Mr. Tavares at 385 N. Arrowhead, San Bernardino, CA 92415. Use zip 92415-0153 for Snyder, 92415-0160 for Tavares.

Printed on 50% recycled paper.

CONTACT LOG (Cont'd)

ADDRESS: 1450 Washington Street	CITY: Colton	
COUNTY: San Bernardino	STATE: CA	ZIP: 92324
CONTACT(S) Gene McMeans	TITLE General Manager	PHONE (909) 825-4128
BEI PERSON MAKING CONTACT: Gregory R. Carroll GC BS		DATE: 9/29/95
SUBJECT: Municipal DrinkingWater System		
SITE NAME: Guyaux Landfill	EPA ID: CAD 983652033	

DISCUSSION:

The Riverside Highland Water Company (RHWC) operates 16 water wells. Some wells supply irrigation water only, some wells supply drinking water only, and some wells supply water for both irrigation and use as a drinking water supply. The latter two groups consist of eight active wells, all of which are called "domestic wells" by the RHWC. The eight domestic wells constitue a single blended system supplying drinking water to approximately 14,000 people. The eight wells used exclusively for irrigation are not connected to the eight domestic wells.

The RHWC wells are located both inside and outside the RHWC service area and occur in in several different groundwater basins including the Bunker Hill, Colton-Rialto, Riverside North, Riverside South, and Lytle Creek basins.

Taste and odor problems have been noted in Linda Vista Well #3, a RHWC well downgradient of the Guyuax Landfill site in the Riverside North basin. Possible low levels of toluene has been detected in this well. In addition trichloroethene (TCE) and tetrachloroethene (PCE) have occasionally been detected in groundwater samples collected from this well, at concentrations of approximately 1.1 or 1.2 parts per billion (ppb).

According to Mr. McMeans, the waste pile at the Guyaux Landfill was once mounded up, but has since been leveled off.

CONTACT REPORT

AGENCY/AFFILIATION: City of Riverside		CODE:
DEPARTMENT: Water Operations		
ADDRESS: 2911 Adams Street	CITY: Riverside	
COUNTY: Riverside	STATE: CA	ZIP: 92506
CONTACT(S) Jack Rowles	TITLE	PHONE (909) 351-6370
BEI PERSON MAKING CONTACT: Gregory R. Carroll GRC 12		DATE: 10/2/95 and 10/19/95
SUBJECT: Municipal Drinking Water System		
SITE NAME: Guyaux Landfill	EPA ID: CAD 983652033	

DISCUSSION:

10/2/95: The City of Riverside obtains approximately 99 percent of its municipal drinking water supply from a blended system of 48 active water wells. The Metropolitan Water District provides the remaining water, approximately 1 percent of the total supply, via a single imported surface water connection. The entire system provides drinking water to approximately 242,000 people.

No single well provides more the 40 percent of the total water supply, and the only water quality problem noted has been high nitrate levels in one well which is currently inactive. Otherwise, no wells have been closed due to contamination.

10/19/95: Flume wells 2, 3, and 6 are in service and could be sampled. Mr. Rowles does not know whether arsenic is naturally occurring in groundwater in the vicinity of the wells. For further information on water quality, contact Cindy Norreid at (909) 351-6331, beginning Monday morning, October 23, 1995.

ADDRESS: 650 North LaCadena Drive	CITY: Colton	
COUNTY: San Bernardino	STATE: CA	ZIP: 92324
CONTACT(S) Lorraine June	TITLE Administrative Analyst	PHONE (909) 370-6132
BEI PERSON MAKING CONTACT: Gregory R. Carroll GRC 10/3		DATE: 10/3/95
SUBJECT: City of Colton municipal drinking water supply		
SITE NAME: Guyaux Landfill	EPA ID: CAD 983652033	

DISCUSSION:

The City of Colton currently owns the following drinking water wells. All wells are active unless otherwise noted. The water is not blended with surface water and is distributed through 8,720 connections. Each well contributes approximately equally to the system. Well identifiers and approximate locations are as follows:

- Wells 9 and 17 - west of Adel Ct.
- Well 19 - north of Rialto Ave., between Rancho Ave. and Mt. Vernon Ave.
- Wells 16, 13, and 8 - south of Rialto Ave. near Well 19
- Well 23 - Fairway Dr. near Orange Hill Rd.
- Wells 14, 7, 5, and 6 - south of Walnut Ave. near the railroad
- Well 22 - Rich Dauer Park on Sugar Pine Ln.
- Well 15 - in the field just north of Watwood Ave.
- Katz Well - Cooley Ln. near Hunts Ln.
- Well 24 - Meridian Ave. north of Olive St.

The Katz Well, formerly used as an agricultural well, has not yet been brought into service due to high concentrations of either nitrates or total dissolved solids. State regulations permit use of this well for only 15 days or less per year, and the Katz Well will therefore be used as a standby well.

SUBJECT: Municipal drinking water system operated by the Terrace Water Company		
SITE NAME: Guyaux Landfill	EPA ID: CAD983652033	

DISCUSSION:

The Terrace Water Company operates a blended municipal drinking water system that obtains water from two wells within the city limits of San Bernardino. The wells are on Rialto Avenue, between Muscott Street and the railroad tracks. Each well contributes equally to a system that provides drinking water to approximate 540 service connections in an unicorporated portion of San Bernardino County near Colton, Calif. No contamination has been noted in either well.

The wells are approximately 320 feet deep with the pumps set at a depth of approximately 180 feet below ground surface.

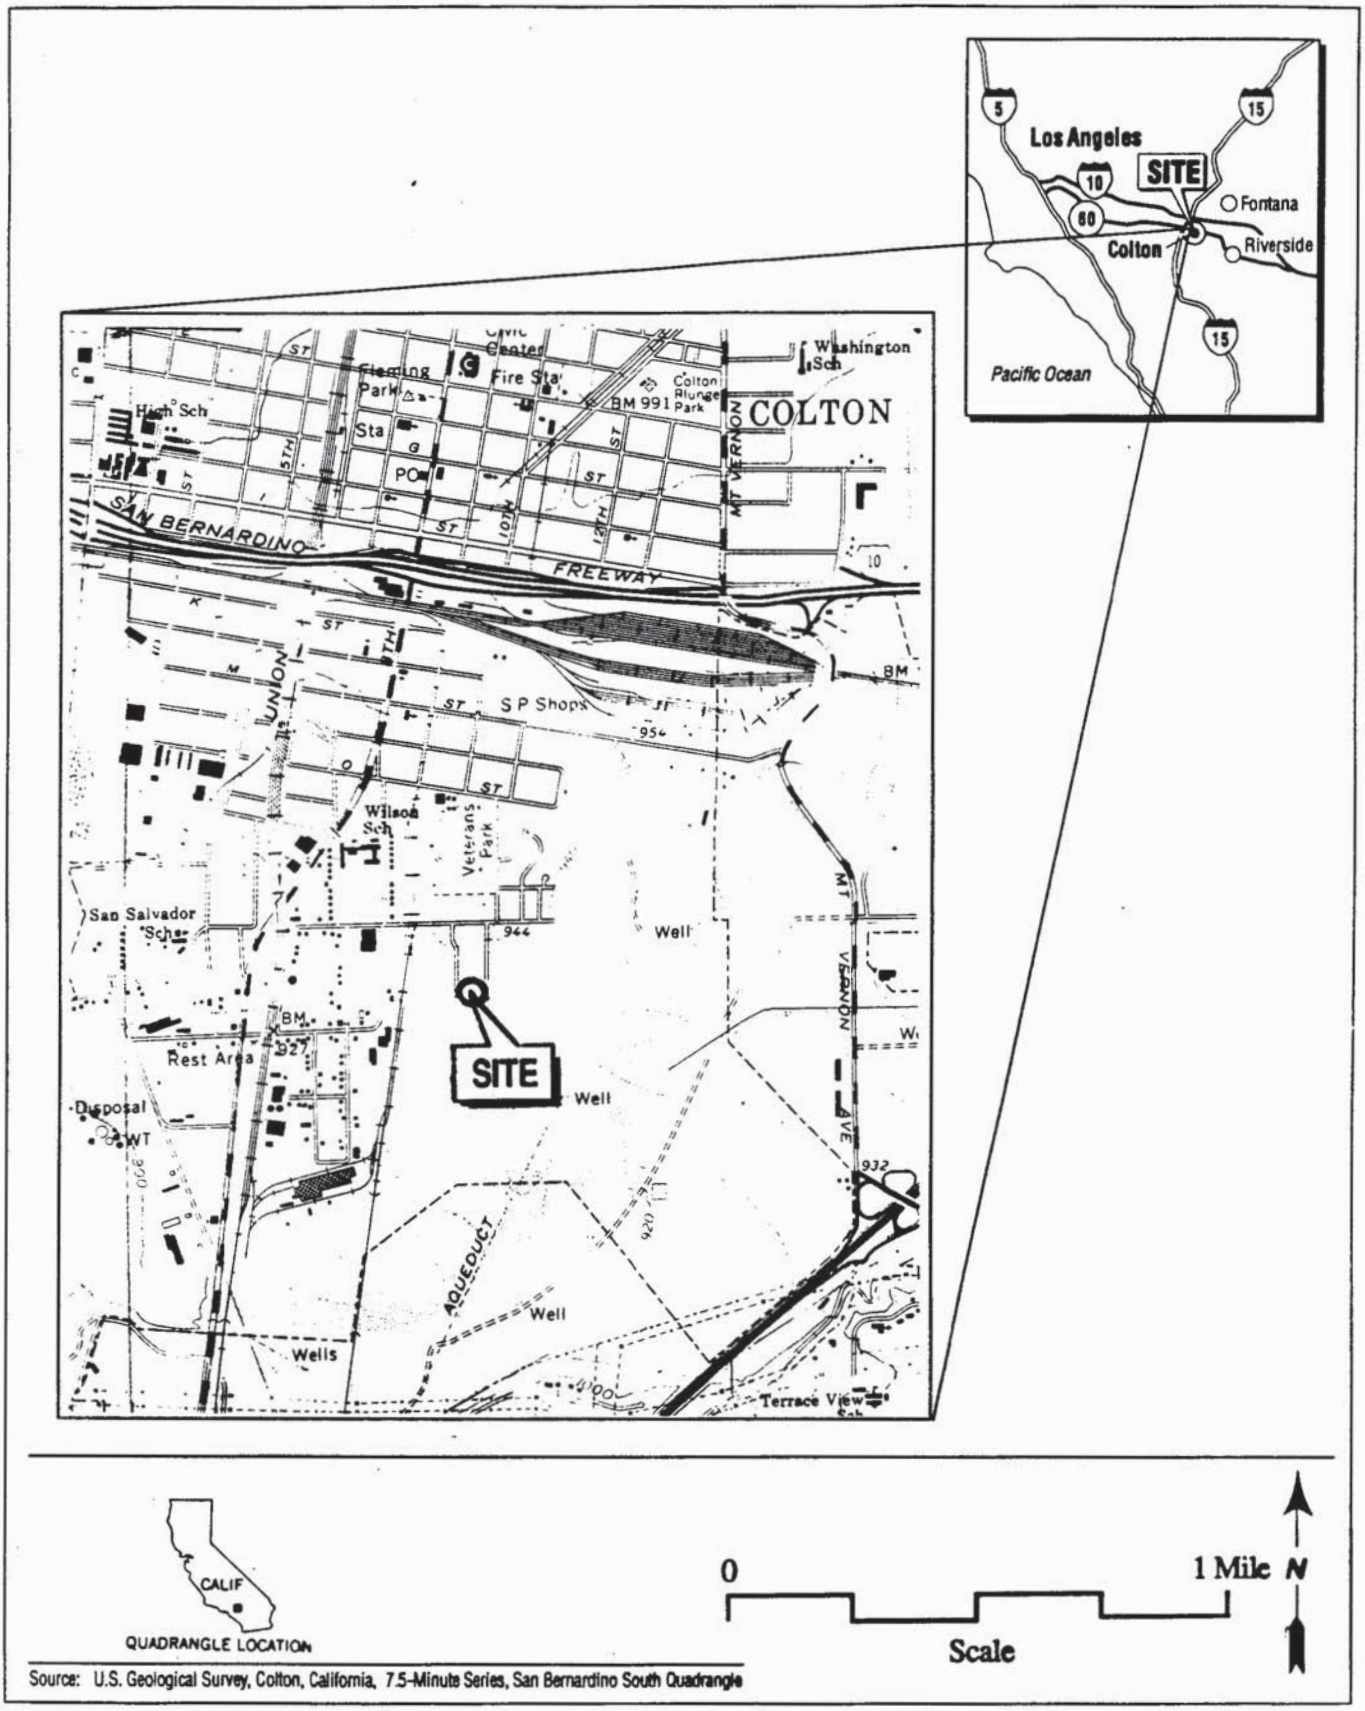
1.0 OBJECTIVES OF SAMPLING EFFORT

Bechtel Environmental, Inc. (BEI) will conduct this field sampling effort to gather data as part of an expanded site inspection (ESI) under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund). The ESI builds upon the body of information developed during the Preliminary Assessment (PA) and the Site Inspection (SI) by verifying and substantiating data collected during the PA and SI, collecting additional data through a site reconnaissance visit, and collecting physical environmental samples to analyze for the presence of hazardous substances.

Field sampling will be conducted under protocol accepted by the U.S. Environmental Protection Agency (EPA) as specified in the *Preparation of a U.S. EPA Region IX Sample Plan for EPA-Lead Superfund Projects* guidance document (Quality Assurance Management Section, U.S. EPA, Region IX, August, 1993) and the programmatic *Quality Assurance Project Plan, Revision 1* (QAPjP) submitted by BEI on January 25, 1995 and approved by the EPA on March 27, 1995. Laboratories participating in the EPA Contract Laboratory Program (CLP) will be utilized for analyses. Laboratory services will be obtained and coordinated through the Regional Sample Control Coordinator in the EPA Region 9 Quality Assurance Management Section (QAMS).

The site being investigated is the Guyaux Landfill site (the site) (CAD 983652033) in Colton, San Bernardino County, Calif (1). From 1930 until 1994, the site was used as a disposal area for wastes including: construction debris, scrap metal, foundry slag, drums, and other containers. These materials were deposed of directly on exposed soil, and some of the drums and containers reportedly leaked. The objective of BEI's sampling effort is to determine the presence and measure the concentrations of hazardous substances in onsite soils and in groundwater hydraulically downgradient of the site. In addition, representative soil undisturbed by site activities, and hydraulically upgradient groundwater will be sampled to establish background concentrations. These data will be used to support decision-making efforts by the EPA as part of the ESI process.

2.0 BACKGROUND



2.1 Location

The Guyaux Landfill site is located at the end of Florez and Fernando streets in Colton, San Bernardino County, Calif. The geographic coordinates for the site are 34° 03' 11.50" N latitude, 117° 19' 15.50" W longitude (Township 1 South, Range 4 West, San Bernardino Baseline and Meridian, San Bernardino South, Calif., 7.5-minute quadrangle) (2). The location of the site is shown in Figure 2-1.

2.2 Site Description

The Guyaux Landfill site is located in a mixed industrial and residential area of Colton, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by vacant land and the Santa Ana River. (3) The site layout is shown in Figure 2-2.

Printed on 50% recycled paper.

Source: U.S. Geological Survey, Colton, California, 7.5-Minute Series, San Bernardino South Quadrangle

Figure 2-1 Site Location

Printed on 50% recycled paper.

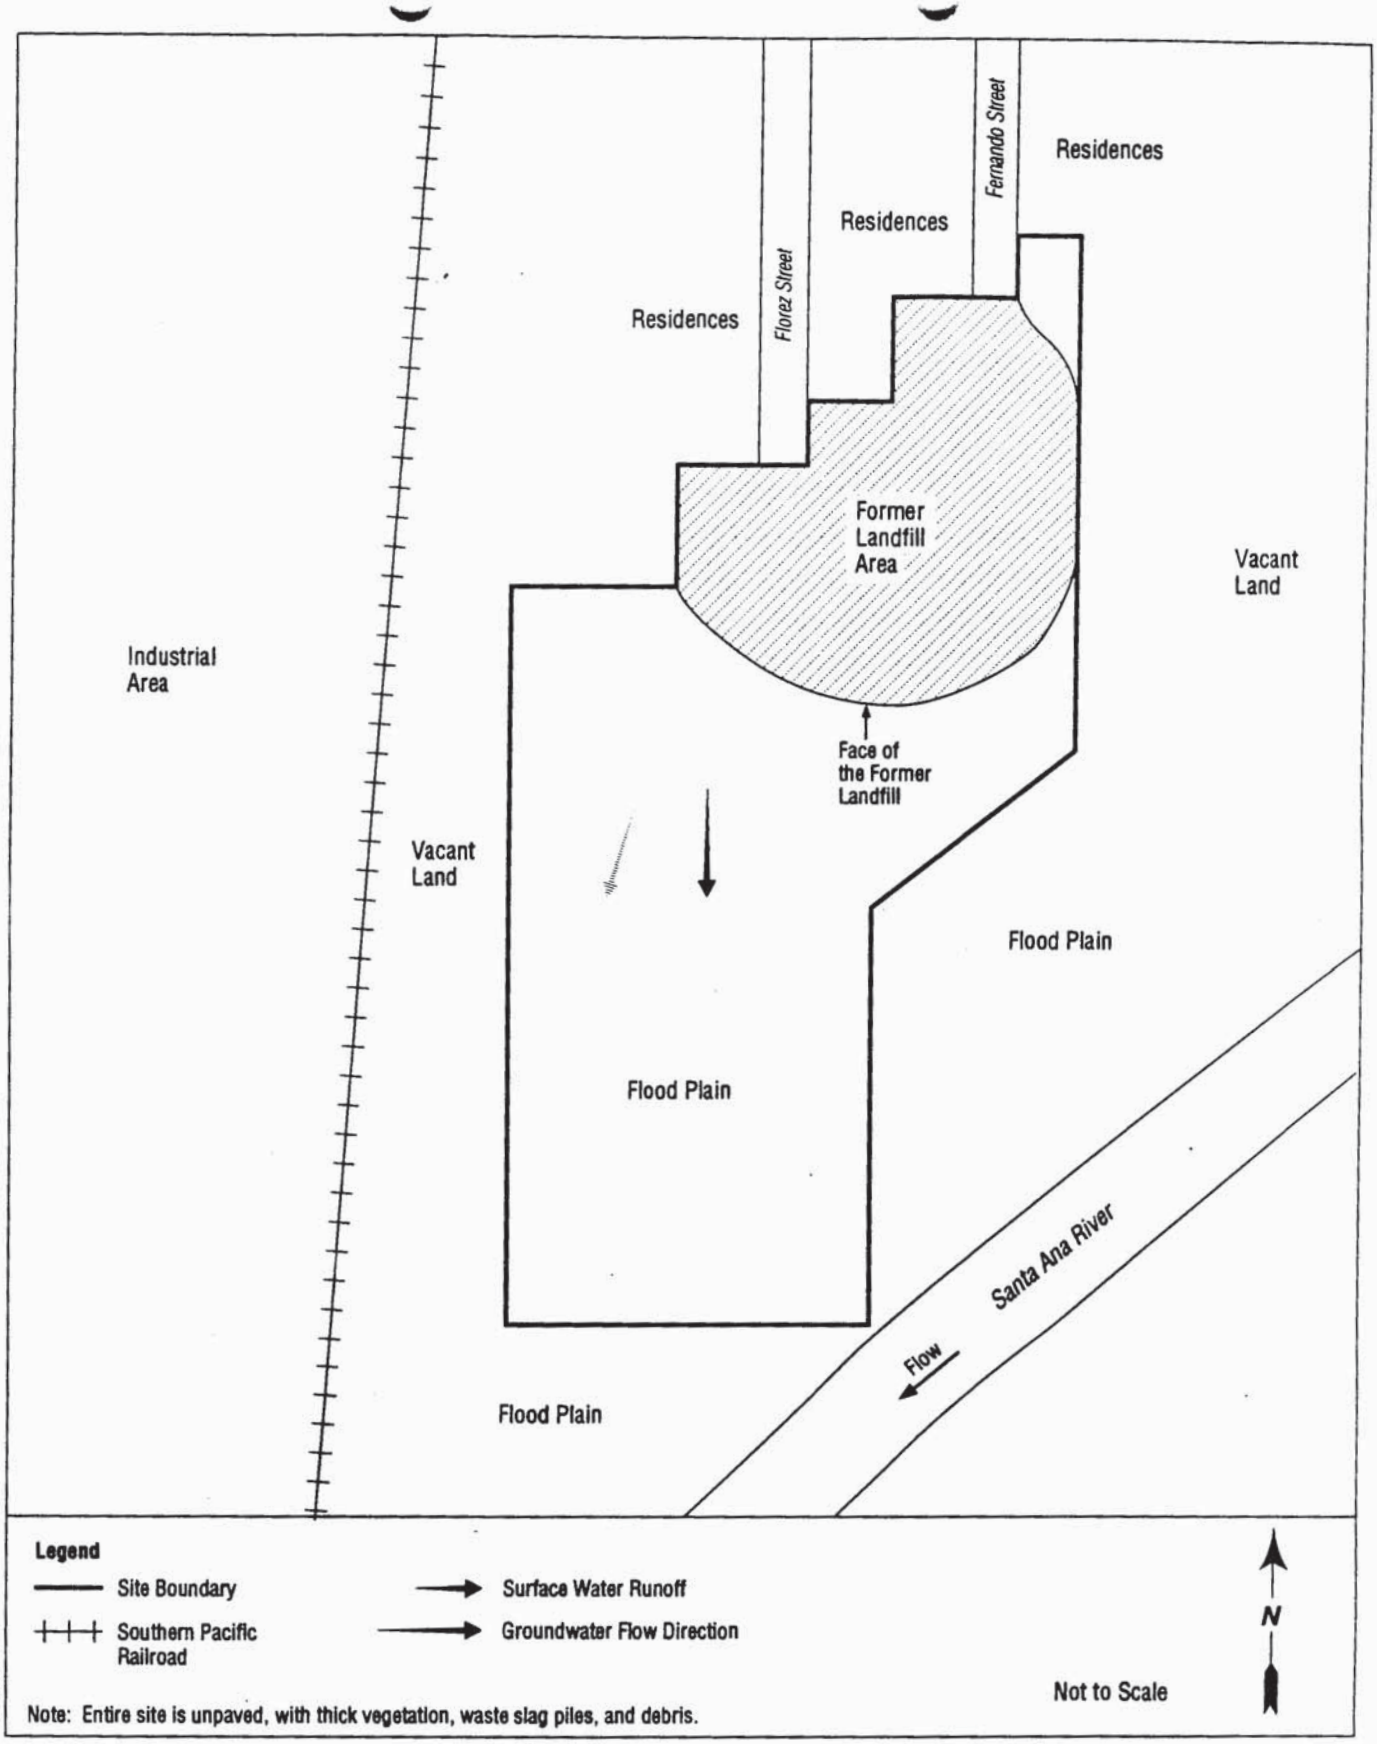


Figure 2-2 Site Layout

Printed on 50% recycled paper.

The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill from 1930 until 1994. The rest of the site is in a floodplain. The elevation of the former landfill is approximately 15 feet higher than the rest of the site. The entire site is unpaved, unfenced, and covered by vegetation. (3)

2.3 Operational History

The Guyaux Landfill site was purchased by Robert and Betty Zandbergen from Henry and Alice Adams in 1966. The Zandbergens held title to the property until July 1994. Ralph Guyaux acquired title to the property in July 1994. (3)

Since 1930, 6 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton was disposed of in the landfill portion of the site. In the 1950s, the landfill was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s and 1980s, the landfill was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company sites. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company were deposited in the landfill. In addition, the landfill accepted waste slag from the Griffin Wheel Company. Since 1985, the landfill portion of the site has been used for the temporary storage of cars and machinery prior to dismantling and reuse. (3)

At the time of the January 1995 BEI site reconnaissance, piles of waste slag were noted along the face and on top of the landfill. Several piles of used tires and pieces of old furniture were also dumped on site. In addition, up to ten 55-gallon drums that appeared to be empty were observed site. (3)

2.4 Previous Investigations

2.4.1 Waste Slag Sampling. Waste slag generated at the Griffin Wheel Company was deposited at the Guyaux Landfill site. In 1989, Dames & Moore, contractors to the Griffin Wheel Company conducted a Phase II environmental site assessment at the Griffin Wheel Company property to characterize the waste slag. Eleven soil borings were drilled in an onsite slag pile during this investigation. The slag samples were analyzed for California Code of Regulations Title 22 (Title 22) metals. Results of laboratory analyses of the samples indicated the presence of Title 22 metals including up to 105 milligrams per kilogram (mg/kg) of arsenic, 72.1 mg/kg of cadmium, and 9,520 mg/kg of lead. (4)

2.4.2 Groundwater Sampling. In 1989, the Santa Ana Watershed Project Authority (SAWPA) conducted a regional hydrogeological study in the vicinity of the site. As part of this study, monitoring wells screened in a shallow perched groundwater zone (approximately 40 feet to 80 feet below ground surface) were installed. Groundwater samples collected from a downgradient monitoring well (A-2) were analyzed for metals. Information on the analytical methods used are not available. Results of laboratory analyses indicated the presence of metals including arsenic at 18 parts per billion (ppb) and barium at 69 ppb. Tetrachloroethene (PCE), and trichloroethene (TCE) were detected in Well A-2 at concentrations of 17 micrograms per liter (µg/l) and 2 µg/l, respectively, during the same sampling event. (5)

In 1993 and 1994, the City of Riverside sampled the agricultural wells in the vicinity of the site. Groundwater samples collected from an agricultural well (Flume 6) downgradient of the site and screened in the drinking-water aquifer were analyzed for metals using EPA Method 6010. Results of laboratory analyses of the groundwater samples indicated the presence of up to 15 ppb of arsenic. A background agricultural well (Flume 2) also screened in the drinking-water aquifer did not contain arsenic above its method detection limit. (6).

2.5 Regulatory Involvement

2.5.1 U.S. Environmental Protection Agency (EPA). The Guyaux Landfill site is not listed in the Resource Conservation and Recovery Information System (RCRIS) database, as of August 25, 1995 (7).

2.5.2 California Environmental Protection Agency.

Regional Water Quality Control Board (RWQCB), Santa Ana Region. The RWQCB has been involved with the site since 1977. In response to a citizen complaint in 1977, the RWQCB requested that the site owner submit a report of waste discharge. In response, an incomplete report of waste discharge was submitted by the site owner to the RWQCB. In 1981, the RWQCB requested that the site owner sample and analyze the waste slag. The site owner did not comply with this request. In 1985, the RWQCB requested a groundwater monitoring network be installed around the site. The site owner did not comply with this request. In 1988, the RWQCB requested a Solid Waste Assessment Test (SWAT) be performed by the site owner. The site owner has not responded to this request. (8)

2.5.3 City of Colton, Community Development Department. (CDD) In 1995, the CDD found the site owner in violation of city property maintenance codes and issued a citation for non-compliance. The city obtained a court order directing the site owner to remove debris from site (i.e., tires, scrap metal, concrete, weeds). In 1995, the site owner complied with the court order, removing debris and weeds from the site to a municipal landfill. According to the CDD, its authority only covers aesthetics, not environmental issues. (9,10)

2.6 Apparent Problem

The apparent problems at the site are:

- In the 1970s and 1980s, waste slag generated at the Griffin Wheel Company, a nearby foundry, was disposed of at the Guyaux Landfill. Results of laboratory analyses of the waste slag samples from the Griffin Wheel Company property indicated the presence of elevated concentrations of metals including arsenic, cadmium, and lead. (4,8)

- Results of laboratory analyses of groundwater samples collected in August 1994 from an agricultural well, downgradient of the site and screened in the drinking-water aquifer, indicated the presence of arsenic at concentrations significantly greater than background levels. (6)

3.0 HAZARD RANKING SYSTEM (HRS) FACTORS

The HRS is a scoring system used to assess the relative threat associated with actual or potential releases of hazardous substances from sites. It is the principle mechanism EPA uses to place sites on the National Priorities List (NPL). The quality of the data obtained from sampling and analysis at a site must be sufficient to meet the criteria for usage in the HRS, in accordance with the data quality objectives (DQO) documented in the *Guidance for Data Usability in Site Assessment*, Interim Final, January 1993, U.S. EPA Office of Emergency and Remedial Response.

3.1 Waste Characteristics

The principal hazardous substance sources at the site are:

- Foundry slag: The Griffin Wheel Company, a foundry and manufacturing facility located less than 0.5 mile from the site disposed of waste slag at the Guyaux Landfill site. Results of laboratory analyses of waste slag samples collected at the Griffin Wheel Company property indicate the presence of elevated concentrations of metals including arsenic, cadmium, and lead. (3,4) Slag samples will be collected at the Guyaux Landfill site in order to determine whether elevated metals concentrations are present.

- Drums and tanks: Drums and containers were disposed of on exposed soil at the Guyaux Landfill site (11,12). According to nearby residents, some of the drums might have been buried (13). Soil samples from the areas of suspected drum or container disposal will be collected to determine whether elevated concentrations of hazardous substances are present.

Based on a review of readily available information, there do not appear to be any offsite sources capable of influencing either the rationale for sampling or the types of analyses recommended.

3.2 HRS Pathways

Based on the SI investigation, the following medium might have been impacted by a release from the Guyaux Landfill site:

- Groundwater in the drinking water aquifer. Since 1989, the estimated depth to groundwater beneath the site has ranged from 35 feet below ground surface (bgs) to over 55 feet bgs. The site is located on channel deposits adjacent to the intermittent Santa Ana River. Geologic materials between the ground surface and the water table consist predominantly of sand and gravel. (14) Groundwater in the drinking water aquifer might contain hazardous substances from the site including metals and volatile organic compounds. Groundwater withdrawn from 49 wells within 4 miles of the site provides drinking water for approximately 176,000 people. (15,16,17,18)

Printed on 50% recycled paper.

Analytical results of a 1989 sampling event indicate the presence of arsenic, PCE and TCE in Well A-2, an onsite monitoring well, at concentrations of 18 micrograms per liter (µg/l), 17 µg/l, and 2 µg/l, respectively (5). However, the quality of the data does not meet HRS acceptance criteria because there is no information available regarding analytical methods or regarding field or laboratory quality assurance/quality control (QA/QC) procedures. Analytical results of an August 1994 sampling event indicate the presence of arsenic in Flume Well 6, a downgradient agricultural well at a concentrations of 11 µg/l. Arsenic was not detected above the laboratory detection limit of 2 µg/l in Flume Well 2, an agricultural well upgradient of the site. Although the quality of the data from the August 1994 sampling event might meet HRS acceptance criteria, arsenic has been detected in Flume Well 2 at concentrations up to 8.3 µg/l in other sampling events. (6,19)

The maximum contaminant levels (MCLs) are 50 µg/l for arsenic, and 5 µg/l for PCE, and TCE (20). The PCE concentration detected in the onsite monitoring well in 1989 (i.e., 17 µg/l) exceeds the MCL for PCE. Although the other hazardous substance concentrations detected in groundwater beneath or near the site are less than their respective MCLs, groundwater withdrawn within 4 miles of the site contributes to three municipal drinking water systems that serve a total of approximately 264,000 people. (15,16,17,18) Establishing a release of hazardous substances from the site to groundwater is contingent on detecting arsenic, PCE, or TCE in a downgradient groundwater sample at concentrations significantly above background levels.

3.3 Sampling Recommendations

3.3.1 Soil Sampling. As shown in Figure 3-1, soil sampling will be conducted at 25 locations. One soil sample will be collected between ground surface and 10 feet bgs at each location. The purpose of soil sampling at the site is to determine whether onsite soils contain metals or volatile organic compounds at concentrations significantly above background levels (i.e., a hazardous substance is detected in an onsite sample at a concentration that is at least three times greater than the concentration detected in background samples, or a hazardous substance is detected in an onsite sample and not detected in background samples). The onsite soil samples will therefore be collected in areas most likely to contain elevated concentrations of hazardous substances. The samples will be collected at 23 onsite locations in order to maximize the likelihood that elevated hazardous substance concentrations on site, if they exist, will be detected during this sampling event.

Several factors were considered when determining the number of samples that will be collected at the site. Laboratory costs, site conditions, and the decisions that will be made were all part of the process. In addition, guidance was obtained from the Data Quality Objectives Decision Error Feasibility Trials (DQO/DEFT) Software, Version 4.0 (EPA 1994). As determined by EPA, iterations with DEFT support the number of samples recommended for collection in Section 4. (23)

Waste materials initially deposited on the ground surface (such as foundry slag) may have been churned into onsite soils during recent grading activities. Because the grading equipment thought to have been used (i.e., backhoes or bulldozers) probably did not churn or cover wastes to depths of greater than 10 feet bgs, hazardous substances in onsite soils are most likely to occur between depths of 0 and 10 feet bgs. Therefore, onsite soil samples will be collected between depths of 0 and 10 feet bgs.

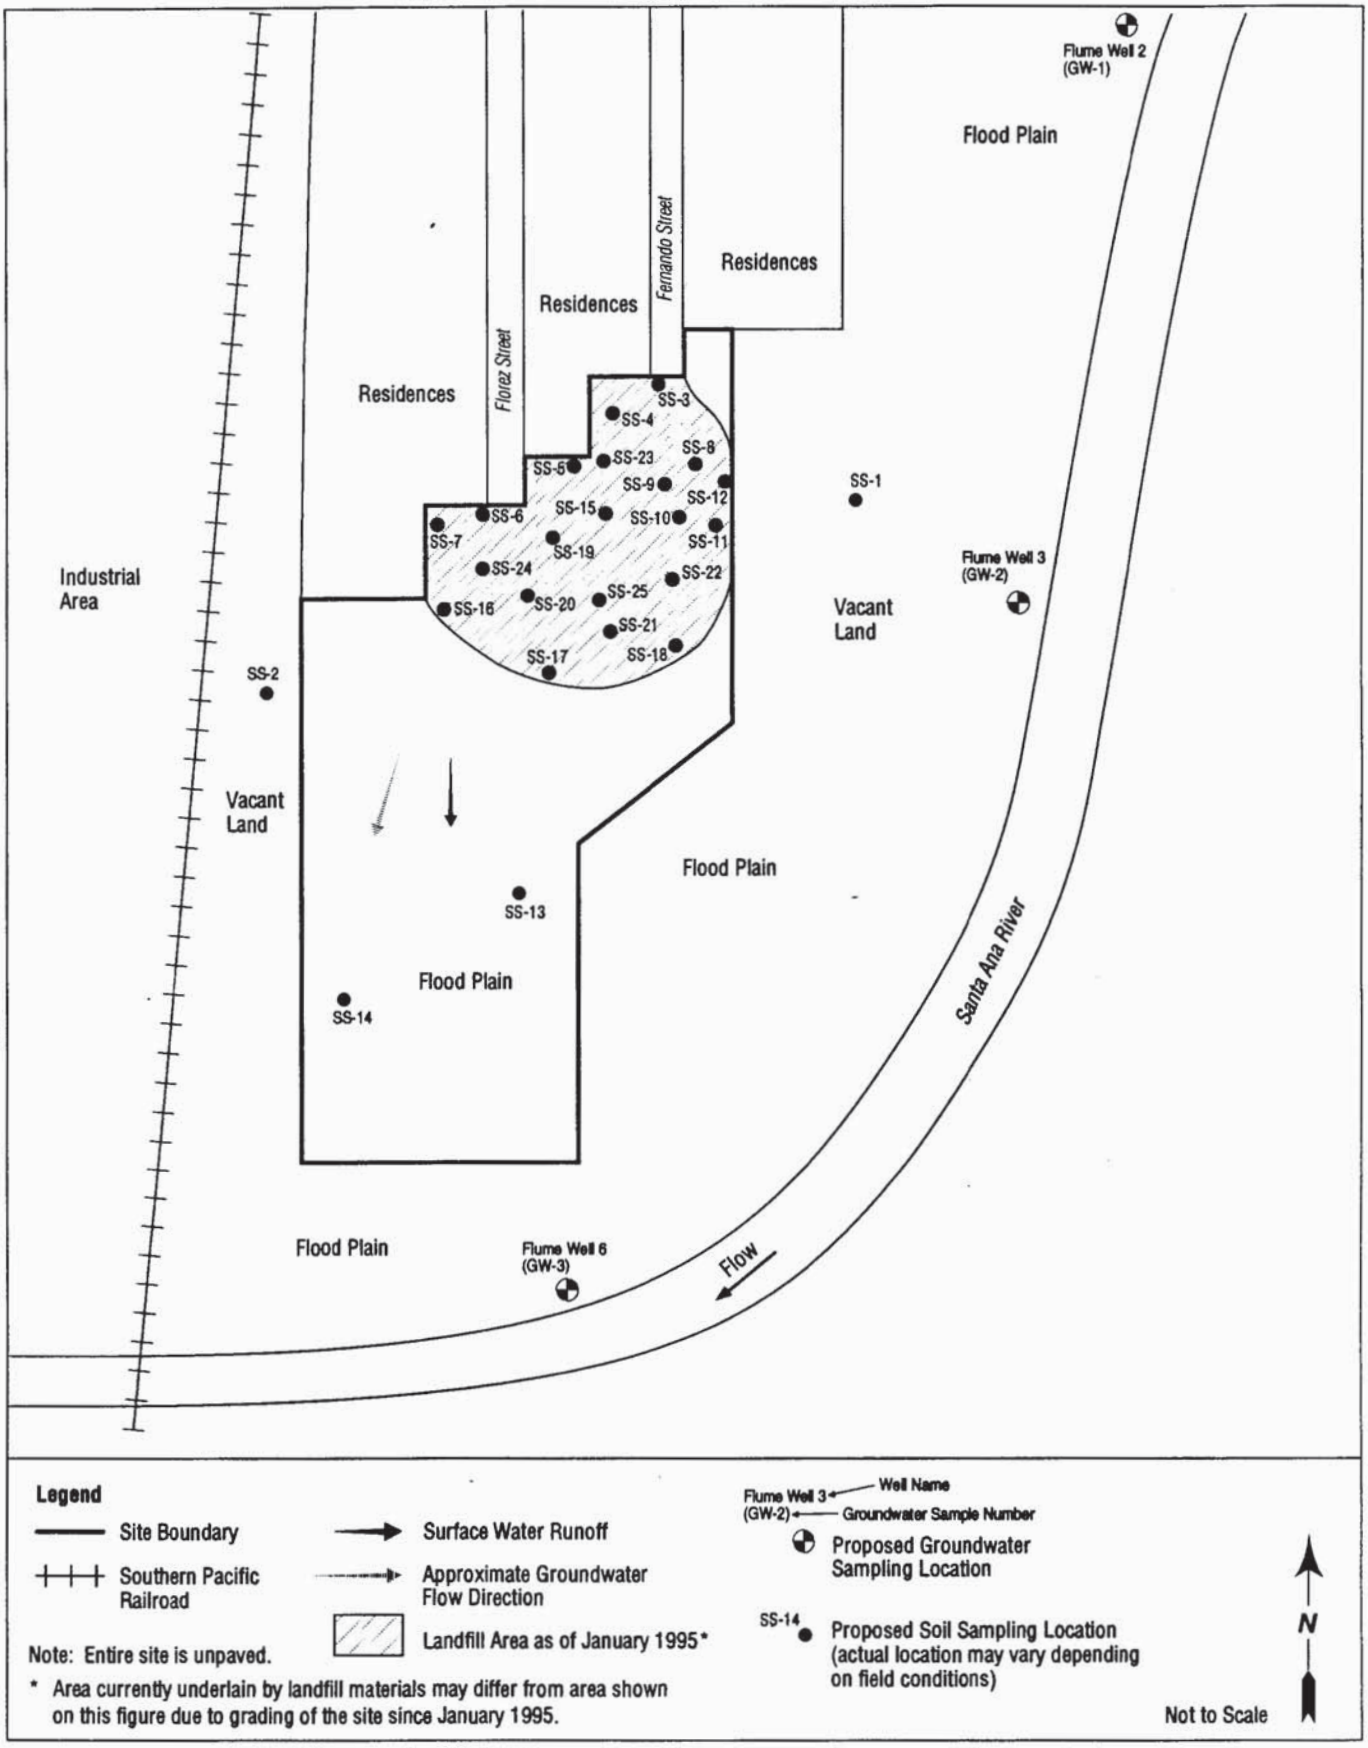

Figure 3-1 Proposed Sampling Locations

The exact sampling locations and depths will be determined in the field because there is not enough information regarding historical operations to indicate exactly where material was historically disposed and because most of the disposed materials may have been mixed into or covered by onsite soils. Nineteen of the actual sample locations will be determined based on visible signs of potential contamination (e.g., stained soils or visible foundry waste), odor, information from site owner and/or nearby residents regarding historical waste disposal locations, and topographical features which may indicate location of hazardous substance disposal (e.g., depressions that may indicate a historic excavation). If visible signs of potential contamination are present at less than 19 locations on the land surface, the remaining locations will be determined by initiating augering and and examining subsurface soils for evidence of contamination. Soil samples will be collected from locations and depths most likely to contain hazardous substances. The remaining 4 onsite sampling locations will be distributed randomly throughout the body of the landfill.

All soil samples will be analyzed using the EPA CLP for Contract Laboratory Program Analytical Services (CLPAS) metals and CLPAS volatile organic compounds.

The last suffix of a soil sample number will indicate the depth in feet from which the sample was collected. For example, sample number SS-1-4 would designate a soil sample collected from sample location SS-1 at a depth of 4 feet bgs.

- Soil samples will be collected at sample locations SS-3 through SS-25 to determine the presence and concentrations of metals and volatile organic compounds on site. Sample locations SS-3 through SS-7 will be in onsite areas nearest to private residences adjacent to the northern edge of the site. Sample locations SS-8 through SS-12 will be in onsite regions potentially affected by drum or container disposal. These areas are probably in the body of the landfill. Sample locations SS-13 and SS-14 will be in the southern portion of the site, in areas least likely to have been affected by onsite operations. Sample locations SS-15 through SS-21 will be in the body of the landfill in areas most likely to have been impacted by slag and foundry waste disposal. Sample locations SS-22 through SS-25 will be collected from random locations in the body of the landfill. These areas are probably in the body of the landfill.

- Soil samples will be collected at locations SS-1 and SS-2 and will be designated as background samples. Background samples are intended to be representative of conditions that existed in the site vicinity before site operations. Sample locations SS-1 and SS-2 are on undeveloped land off site and appear to be representative of conditions that existed at the site prior to the disposal of potentially hazardous substances on site from 1930 to 1994. Sample location SS-1 is on a vacant lot east of the site, in the Santa Ana River floodplain. Sample location SS-2 is on a vacant lot west of the site. The samples will be collected at locations on the vacant lots that are least likely to have been affected by onsite activities (i.e., at undisturbed locations not downstream from the landfill).

The purpose of onsite soil sampling is to determine whether hazardous substances are present in onsite soils at concentrations significantly above background levels. The soil samples submitted

for analysis will be the ones collected at locations and depths judged most likely to contain the highest concentrations of hazardous substances. Therefore, the exact sampling locations and depths will be determined in the field based on accessibility, visible signs of potential contamination (e.g., stained soils, visible foundry waste), and topographical features which may indicate location of hazardous substance disposal (e.g., depressions that may indicate a historic excavation). Any deviations will be described in the ESI report.

The depth of an onsite soil sample in one location may differ from the depth of an onsite soil sample in another location because the depth at which visible signs of potential contamination may vary between sampling locations. Collecting soil samples at a consistent depth is not a consideration in this sampling event because the purpose of this sampling event is to find, collect and analyze soil samples most likely to contain elevated concentrations of hazardous substances, not to characterize onsite soils at a given depth.

The 26 onsite soil samples will be collected at depths at which the highest concentrations of hazardous substances are most likely to occur (according to field observations at the time of sampling). If onsite samples are collected at more than two depths, then the depths of the two background soil samples at depths will not precisely match every depth at which onsite samples are collected. However, the background samples (to be collected from undisturbed, natural soils) will be collected from soils significantly different from materials from which the onsite soil samples will be collected (i.e., disturbed soils mixed with landfill materials). Therefore, it is not necessary to collect background soil samples at the same depth interval as onsite soil samples. As a result, instead of precisely matching the depths of all onsite soil samples, the depth of the background soil samples will be determined based on the median depth of onsite soil samples submitted for analysis. For example, if the median depth of onsite soil samples is 4 feet bgs, then the background soil samples will be collected at that depth.

3.3.2 Groundwater Sampling. As shown in Figure 3-1, groundwater sampling will be conducted at three agricultural wells screened in the drinking water aquifer: one hydraulically upgradient of the site, one potentially downgradient of the site, and one hydraulically downgradient of the site. The depth to groundwater in the vicinity of the site ranges from 35 feet bgs to over 55 feet bgs, and groundwater underneath the site flows to the south. No monitoring well sampling is planned because the monitoring wells sampled during the 1989 sampling event were destroyed. (21)

All groundwater samples will be analyzed through the EPA CLP Regional Analytical Program (RAP) using RAP analysis for volatile organic compounds with low detection limits and RAP metals analysis with lower detection limits (5 µg/l) for arsenic. The RAP method was chosen in order to obtain low detection limits for arsenic and volatile organic compounds in groundwater samples.

The following rationale were used to determine the sample locations:

- Sample GW-1 will be collected from Flume Well 2, an agricultural well hydraulically upgradient from the site that will be used for the designated background groundwater sample. Background samples are intended to be representative of conditions that exist in the site vicinity. Flume Well 2 is the well at Township 1 South, Range 4 West, Section 29, Lot H, which is approximately 0.4 mile northeast of the site.

- Sample GW-2 will be collected from Flume Well 3, an agricultural well potentially hydraulically downgradient from the site. Flume Well 3 is the well at Township 1 South, Range 4 West, Section 29, Lot R, which is approximately 0.25 mile east of the site. There are no known potential hazardous substance sources between the site and Flume Well 3.

- Sample GW-3 will be collected from Flume Well 6, an agricultural well approximately 0.5 mile hydraulically downgradient (south) of the site and will be used to determine the presence and measure the concentration of contaminants in groundwater downgradient of the site. Flume Well 6 is the well at Township 1 South, Range 4 West, Section 29, Lot Q. This sample location was chosen to assist in the determination of the extent of potential groundwater contamination. There are no known potential hazardous substance sources between the site and Flume Well 6.

4.0 REQUEST FOR ANALYSES

The Guyaux Landfill site was identified as a potential hazardous waste site and entered into the CERCLIS database on December 9, 1992 (CAD 983652033). BEI will conduct this field sampling effort to gather data as part of an ESI under CERCLA. The anticipated sampling dates for this sampling effort are March 11, 1996 through March 15, 1996. The following samples (including duplicate, QA/QC, and equipment rinsate samples) will be collected and analyzed as part of this effort:

- Twenty-eight (28) low concentration soil samples for CLPAS metals and CLPAS volatile organic compounds.

- Nine (9) groundwater and equipment rinsate blank samples for CLPAS metals and RAP volatile organic compounds.

- Five (5) low concentration groundwater and equipment rinsate blank samples for RAP metals (arsenic only) with a low detection limit.

- One (1) performance evaluation water sample for RAP metals (arsenic only) with a low detection limit, CLPAS metals and RAP volatile organic compounds.

4.1 Soil Sample Analyses

As described in Table 4-1, soil samples will be taken at 25 locations: SS-3 through SS-25 and background locations SS-1 and SS-2. Single volume soil samples collected at the following sample locations will be identified to the laboratory for use in laboratory QA/QC procedures: SS-10 and SS-20. Duplicate soil samples will be collected at the following sample locations: SS-9, SS-17, and SS-21. These samples were chosen as the designated duplicate or QA/QC samples because they will be collected from suspected sources of onsite contamination.

As shown in Table 4-1, each soil sample (including laboratory QA/QC samples) will be analyzed for CLPAS metals and CLPAS volatile organic compounds.

4.2 Groundwater Analyses

As shown in Table 4-2, groundwater samples will be collected at three locations: Flume Well 2, Flume Well 3, and Flume Well 6. A single volume groundwater sample (GW-2) collected at Flume Well 3 will be identified to the laboratory for use in laboratory QA/QC. A duplicate groundwater sample (GW-4) will be collected at the following sample location: Flume Well 6. These samples were chosen as the designated duplicate or QA/QC samples because they will be collected from sampling locations where the highest hazardous substance concentrations are expected.

As shown in Table 4-2, each groundwater sample (including laboratory QA/QC samples) will be analyzed through the EPA RAP analysis for volatile organic compounds with low detection limits, CLPAS analysis for metals, and RAP analysis for arsenic with lower detection limits. The RAP methods were chosen in order to obtain low detection limits for arsenic and volatile organic compounds in groundwater samples. Low detection limits are necessary because historical analytical data from the site and its vicinity indicate that the detected concentrations of these hazardous substances in downgradient groundwater samples have ranged from less than the CLPAS detection limits to slightly higher than the CLPAS detection limits, yet significantly above background levels.

4.3 Equipment Rinsate Analyses

Equipment rinsate blanks will be prepared as described in Section 8.1. Equipment rinsate samples for soil sampling equipment will be analyzed for CLPAS metals and RAP volatile organic compounds. Equipment rinsate samples for groundwater sampling equipment will be analyzed for RAP analysis for volatile organic compounds with low detection limits, CLPAS analysis for metals, and RAP analysis for arsenic with lower detection limits. The equipment rinsate blanks will be prepared following the decontamination of soil and groundwater sampling equipment used to collect samples from sample locations most likely to be contaminated. Table 4-2 shows the tentative locations for equipment rinsate blanks. Four (4) equipment rinsate blanks will be prepared following the decontamination of the sampling equipment used to collect soil samples at sample locations SS-9, SS-17, SS-21, and the groundwater sample at Flume Well 6. A minimum of one equipment rinsate blank will be collected for each day per matrix that sampling equipment is decontaminated in the field.

A minimum of one equipment rinsate blank will be collected each day that soil and groundwater sampling equipment is decontaminated in the field. All three wells (Flume Well 2, Flume Well 3, and Flume Well 6) proposed to be sampled have dedicated pumps. As a result, sample containers can be filled at an outlet at each wellhead. The only sampling equipment planned for use on all three wells is water level and water depth sounding equipment. If the well depth is not sounded, then no equipment rinsate blank will be prepared for groundwater sampling.

If no equipment rinsate blank is prepared for the groundwater will be analyzed for RAP analysis for volatile organic compounds with low detection limits, CLPAS analysis for metals, and RAP analysis for arsenic with lower detection limits. The field blank will be prepared following collection of sample GW-3 (from Flume Well 6), the groundwater sample from the sample location most likely to be contaminated. Table 4-2 shows the locations for the equipment rinsate and field blanks.

5.0 METHODS AND PROCEDURES

This section describes the methods and procedures that will be used to collect soil and groundwater samples. All samples will be handled in accordance with approved QAPjP procedures and the chain-of-custody guidelines specified in Section 7.3 and transferred into pre-cleaned containers. The containers will be labeled as described in Section 7.5, sealed with tape, and placed in coolers for transport to the laboratory. Samples will be collected in containers and preserved as specified in Section 7.2. Samplers will don clean, disposable latex gloves at each sampling location.

5.1 Soil Sampling

Exact soil sampling locations and depths will be determined in the field based on accessibility, visible signs of potential contamination (e.g., stained soils, visible foundry waste in soil), and topographical features which may indicate location of hazardous substance disposal (e.g., depressions that may indicate a historic excavation). Soil sample locations will be recorded in the field logbook when sampling is completed. A sketch of the sample location will be entered into the logbook and any physical reference points will be labeled. If possible, distances to the reference points will be given.

Soil samples will be collected by boring to the desired sample depth using a 3-inch-diameter hand auger. The sample depth will be determined in the field based on observations of surface soil at the sampling location, as well as observation of soil removed during boring. Anticipated sampling depths are between 0 and 10 feet bgs. Once the desired sample depth is reached, the hand auger will be removed from the hole and accumulated soil will be set aside in a sample-dedicated, disposable pail or on a sample-dedicated, disposable tarp. A clean, modified California split-spoon sampler will be inserted into the borehole and driven into the soil using an manually operated slide hammer. The 2-inch-diameter, 6-inch-long brass liners containing the sample will be removed and capped.

In situations where samples cannot be collected in a brass liner, samples may be collected using a clean hand auger. Samples to be analyzed for CLPAS volatile organic compounds will be collected first. Samples to be analyzed for CLPAS volatile organic compounds will be transferred directly from the auger with a trowel to the appropriate sample containers (i.e., 8-ounce, wide-mouth glass jars). Samples to be analyzed for metals will be transferred from the auger to a sample-dedicated 1-gallon disposable pail and homogenized with a trowel. Material in the pail will be transferred with a trowel from the pail to the appropriate sample containers. Sample containers will be filled to the top with measures taken to prevent soil from remaining in the lid threads prior to being sealed to prevent potential contaminant migration to or from the sample. After sample containers are filled, they will be immediately sealed, chilled if appropriate, and processed for shipment to the laboratory.

Soil samples may also be collected by digging to the desired depth using a decontaminated shovel. The sample depth will be determined in the field based on observations of surface soil at the sampling location, as well as observation of soil removed during digging. Once the desired sample depth is reached, the shovel will be removed from the hole and accumulated soil will be set aside in a sample-dedicated, disposable pail or on a sample-dedicated, disposable tarp. A

different, clean trowel, hand auger, or split-spoon sampler will be inserted into the hole and used to collect the sample.

Excess soil from the sampled interval will be repacked into the hole. Set-aside soil from the interval above the sampled interval will then be repacked into the hole.

5.2 Groundwater Sampling

5.2.1 Water-Level Measurements. If well heads are accessible, all wells will be sounded for depth to water from top of casing and total well depth prior to purging. An electronic sounder, accurate to the nearest 0.01 feet, will be used to measure depth to water in each well. When using an electronic sounder, the probe is lowered down the casing to the top of the water column, the graduated markings on the probe wire or tape are used to measure the depth to water from the surveyed point on the rim of the well casing. Typically, the measuring device emits a constant tone when the probe is submerged in standing water and most electronic water level sounders have a visual indicator consisting of small light bulb or diode that turns on when the probe encounters water. Total well depth will be sounded from the surveyed top of casing by lowering the weighted probe to the bottom of the well. The weighted probe will sink into silt, if present, at the bottom of well screen. Total well depths will be measured by lowering the weighted probe to the bottom of the well and recording the depth to the nearest 0.1 feet.

Water-level sounding equipment will be decontaminated before and after use in each well. Water levels will be measured in wells which have the least amount of known contamination first. Wells with known or suspected contamination will be measured last.

5.2.2 Purging. All wells will be purged prior to sampling. If the well casing volume is known, a minimum of three casing volumes of water will be purged using the dedicated well pump. Water will be collected into a measured bucket to record the purge volume. Casing volumes will be calculated based on total well depth, standing water level, and casing diameter. One casing volume will be calculated as:

$$V = \pi d^2 h / 77.01$$

where:

V is the volume of one well casing of water (in gallons, 1 ft^3 = 7.48 gallon);

d is the inner diameter of the well casing (in inches); and

h is the total depth of water in the well (in feet).

Prior to the start of purging, in the middle of purging each casing volume, and after each well casing volume is purged; water temperature, pH, and specific conductance will be measured using field test meters and the measurements will be recorded. If the well casing volume is not known, water temperature, pH, and specific conductance will be measured every 2.5 minutes after starting water flow. Samples will be collected after these parameters have stabilized; indicating representative formation water is entering the well. Three consecutive measurements which display consistent values of all parameters will be taken prior to sampling. Samples will be collected after three well casing volumes (15 minutes if the purge volume is not known) if parameters have stabilized. Typically, the temperature should not vary by more than +/- 1°C, pH

by more than 0.2 pH units, and specific conductance by more than 10 percent from reading to reading. No water that has been tested with a field meter probe will be collected for chemical analysis. If these parameters have not stabilized after five casing volumes have been purged (30 minutes if the purge volume is not known), purging will cease, a notation will be recorded in the field logbook and samples will be collected. In accordance with Section 7.1, depth to water measurements, field measurements of parameters, and purge volumes will be recorded in the field logbook.

If a well dewaters during purging and three casing volumes are not purged, that well will be allowed to recharge up to 80 percent of the static water column and dewatered once more. After water levels have recharged to 80 percent of the static water column, groundwater samples will be collected.

All field meters will be calibrated according to manufacturers guidelines and specifications before and after every day of field use. Field meter probes will be decontaminated before and after use at each well.

5.2.3 Well Sampling. Prior to sampling each well, the water level in the well will be measured as described in Section 5.2.1 and the well purged as described in Section 5.2.2. All wells will be sampled within 24 hours of purging. Supply wells with a dedicated pump will have samples taken directly from the tap closest to the well head. All aerators, strainers, or hoses will be removed from the tap prior to sample collection. The flow will be adjusted so that a gentle stream is obtained. A flow rate of less than 100 milliliters per minute is recommended for samples to be analyzed for volatile organic compounds to minimize volatilization.

At each sampling location, all bottles designated for a particular analysis (e.g., RAP volatile organic compounds with low detection limits) will be filled sequentially before bottles designated for the next analysis are filled (e.g., RAP metals). If a duplicate sample is to be collected at this location, all bottles designated for a particular analysis for both sample designations will be filled sequentially before bottles for another analysis are filled. In the filling sequence for duplicate samples, bottles with the two different sample designations will alternate (e.g., RAP volatile organic compounds designation GW-3, RAP volatile organic compounds designation GW-4 (duplicate of GW-3), RAP metals designation GW-3, etc.) Groundwater samples will be transferred from the tap directly into the appropriate sample containers with preservative if required, chilled if appropriate, and processed for shipment to the laboratory. When transferring samples, care will be taken not to touch the tap to the sample container.

Vials for volatile organic compound analysis will be filled first to minimize aeration of water in the well. A test vial will be preserved with HCl to determine the amount of preservative needed to lower the pH to less than 2. The appropriate amount of HCl will then be added to the sample vials prior to the addition of the sample. The vials will be filled directly from the tap. The vial will be inverted and checked for air bubbles to insure zero headspace. If a pea-size or larger air bubble appears, the vial contents will be emptied into the container used to measure purge volumes, the vial discarded, and a new sample will be collected.

Samples designated for RAP metals analysis will be filtered. A 5-micron filter will be used to remove larger particles that have been entrained in the water sample. A sample-dedicated Teflon tube will be attached to the tap closest to the well head. The filter will be attached to the outlet of the Teflon tube. A clean, unused filter will be used for each filtered sample collected.

Groundwater samples will be transferred from the filter directly into the appropriate sample containers with a preservative and processed for shipment to the laboratory. When transferring samples, care will be taken not to touch the filter to the sample container. After the filtered sample has been collected, the Teflon tube and filter will be removed and an unfiltered sample will be collected. A sample number appended with an "F1" will represent a sample filtered with a 5 micron filter.

5.3 Equipment Rinsate and Field Blanks

Equipment rinsate blanks will be collected to evaluate field sampling and decontamination procedures by pouring high performance liquid chromatography (HPLC) solvent-free water (for organics) or deionized water (for inorganics) over the decontaminated sampling equipment. One equipment rinsate blank will be collected per matrix each day that sampling equipment is decontaminated in the field. Equipment rinsate blanks will be obtained by passing water through or over the decontaminated sampling devices used that day. The rinsate blanks that are collected will be analyzed using RAP analyses for metals and volatile organic compounds.

Field blanks will be collected to evaluate field sampling and decontamination procedures by pouring HPLC solvent free water (for organics) or deionized water (for inorganics) into a sampling container. One field blank will be collected per matrix each day that groundwater sampling equipment is not used in the field. The field blanks that are collected will be analyzed using RAP analyses for metals and volatile organic compounds.

The equipment rinsate blanks will be preserved, packaged, and sealed in the manner described in Section 7.5 of this sample plan. A separate CLP sample number and station number will be assigned to each sample, and it will be submitted blind to the laboratory.

5.4 Decontamination Procedures

The decontamination procedures that will be followed are in accordance with approved QAPjP procedures. Decontamination of sampling equipment must be conducted consistently as to assure the quality of samples collected. All equipment that comes into contact with potentially contaminated soil or water will be decontaminated. Disposable equipment intended for one time use will not be decontaminated but will be packaged for appropriate disposal. Decontamination will occur prior to and after each use of a piece of equipment. All sampling devices used, including trowels and augers, will be steam-cleaned or decontaminated according to EPA Region IX recommended procedures.

The following, to be carried out in sequence, is an EPA Region IX recommended procedure for the decontamination of sampling equipment:

- Non-phosphate detergent and tap water wash, using a brush if necessary
- Tap-water rinse
- 0.1 N nitric acid rinse
- Deionized/distilled water rinse

- Pesticide-grade solvent (reagent grade hexane) rinse in a decontamination bucket
- Deionized/distilled water rinse (twice)
- Organic-free water rinse (HPLC) grade

Equipment will be decontaminated in a predesigned area on pallets or plastic sheeting, and clean bulky equipment will be stored on plastic sheeting in uncontaminated areas. Cleaned small equipment will be stored in plastic bags. Materials to be stored more than a few hours will also be covered.

6.0 DISPOSAL OF RESIDUAL MATERIALS

In the process of collecting environmental samples at the Guyaux Landfill site during the ESI, the BEI site team will generate different types of potentially contaminated investigation-derived wastes (IDW) that include the following:

- Used personal protective equipment (PPE).
- Disposable sampling equipment.
- Decontamination fluids.
- Soil cuttings from soil borings.
- Purged groundwater and excess groundwater collected for sample container filling.

The EPA's National Contingency Plan (NCP) requires that management of IDW generated during SIs comply with all applicable or relevant and appropriate requirements (ARARs) to the extent practicable. The sampling plan will follow the *Office of Emergency and Remedial Response (OERR) Directive 9345.3-02* (May 1991) which provides the guidance for the management of IDW during ESIs. In addition, other legal and practical considerations that may affect the handling of IDW will be considered.

Listed below are the procedures that will be followed for handling the IDW. The procedures have enough flexibility to allow the site investigation team to use its professional judgment on the proper method for the disposal of each type of IDW generated at each sampling location:

- Used PPE and disposable equipment will be double bagged and placed in a municipal refuse dumpster on site. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of which can still be reused will be rendered inoperable before disposal in the refuse dumpster.
- Decontamination fluids that will be generated in the ESI will consist of dilute nitric acid, pesticide-grade solvent, HPLC or deionized water, residual contaminants, and water with non-phosphate detergent. The volume and concentration of the decontamination fluid will be sufficiently low to allow

disposal at the site. The water (and water with detergent) will be poured onto the ground or into a storm drain. Pesticide-grade solvents will be allowed to evaporate from the decontamination bucket. The nitric acid will be diluted and/or neutralized with sodium hydroxide and tested with pH paper before pouring onto the ground or into a storm drain.

- Soil cuttings generated during the subsurface sampling will be placed back into the soil borings from which the samples were obtained. Any remaining soil cuttings will be spread around the sampling location.

- Purged groundwater will be discharged into irrigation canals or into the Santa Ana River, according to the usual practices of the City of Riverside (the well owner) (22).

7.0 SAMPLE DOCUMENTATION AND SHIPMENT

7.1 Field Logbooks

Field logbooks will document where, when, how, and from whom any vital project information was obtained. Logbook entries will be complete and accurate enough to permit reconstruction of field activities. A separate logbook will be maintained for each project. Logbooks are bound with consecutively numbered pages. Each page will be dated and the time of entry noted in military time. All entries will be legible, written in black ink, and signed by the individual making the entries. Language will be factual, objective, and free of personal opinions or other terminology which might prove inappropriate.

At a minimum, the following information will be recorded during the collection of each sample:

- Sample location and description
- Site sketch showing sample location and measured distances
- Sampler's name(s)
- Date and time of sample collection
- Designation of sample as composite or grab
- Type of sample (i.e., matrix)
- Type of sampling equipment used
- Onsite measurement data (e.g., temperature, pH, conductivity, etc.)
- Field observations and details important to analysis or integrity of samples (e.g., heavy rains, odors, colors, etc.)
- Preliminary sample descriptions (e.g., for soils: clay loam, very wet; for groundwater: clear water with strong ammonia-like odor)

- Type(s) of preservation used
- Lot numbers of the sample containers, sample tag numbers, chain-of-custody form numbers, and chain-of-custody seal numbers
- Shipping arrangements (overnight air bill number)
- Recipient laboratory(ies).

In addition to the sampling information, the following specifics will also be recorded in the field logbook for each day of sampling:

- Team members and their responsibilities
- Time of site arrival/entry on site and time of site departure
- Other personnel on site
- A summary of any meetings or discussions with any potentially responsible parties (PRPs), representatives of PRPs, or federal, state, or other regulatory agencies
- Deviations from sampling plans, site safety plans, and QAPjP procedures
- Changes in personnel and responsibilities as well as reasons for the changes
- Levels of safety protection
- Calibration readings for any equipment used and equipment model and serial number.

7.2 Bottles and Preservatives

The number of sample containers, volumes, and materials are listed in the Section 4.0, Request for Analyses tables. The containers are pre-cleaned and will not be rinsed prior to sample collection. Preservatives, if required, will be added by BEI to the containers prior to shipment of the sample containers to the laboratory.

7.2.1 Soil Samples

CLPAS Volatile Organic Compounds. Soil samples to be analyzed for CLPAS volatile organic compounds will be transferred directly from the sampling equipment into 120-milliliter (ml), wide-mouth glass vials using a trowel. For each sample, two 120-ml glass vials will be collected for each laboratory. The samples will be chilled to 4°C immediately upon collection.

CLPAS Metals. Soil samples to be analyzed for CLPAS metals will be homogenized and transferred from the sample-dedicated homogenization pail into 8-ounce, wide-mouth glass jars. For each sample, one 8-ounce glass jar will be collected for each laboratory. Samples do not need to be chilled.

7.2.2 Groundwater Samples

RAP Volatile Organic Compounds. Low concentration groundwater samples to be analyzed for RAP volatile organic compounds will be collected in 40-ml glass vials. 1:1 hydrochloric acid (HCl) will be added to the vial prior to sample collection. During purging, the pH will be measured using a pH meter on at least one vial at each sample location to ensure the pH is less than 2. The tested vial will be discarded. If the pH is greater than 2, additional HCl will be added to the sample vials. Another vial will be pH tested to ensure the pH is less than 2. The tested vial will be discarded. The vials will be filled so that no headspace occurs. The samples will be chilled to 4°C immediately upon collection. Three vials of each groundwater sample is required for each laboratory.

RAP Metals. Low concentration groundwater samples collected for RAP metals analysis will be collected in 1-liter polyethylene bottles. The samples will be preserved by adding in nitric acid (HNO_3) to the sample bottle. The bottle will be capped and lightly shaken to mix in the acid. A small quantity of sample will be poured into the bottle cap where the pH will be measured using pH meter. The pH must be less than or equal to 2. The sample in the cap will be discarded, and the pH of the sample will be adjusted further if necessary. The samples will be chilled to 4°C immediately upon collection. One bottle of each groundwater sample is required for each laboratory.

7.2.3 Equipment Rinsate and Field Blanks

RAP Volatile Organic Compounds. Low concentration equipment rinsate and field blanks to be analyzed for volatile organic compounds will be collected in 40-ml glass vials. 1:1 hydrochloric acid (HCl) will be added to the vial prior to sample collection. The pH will be measured using a pH meter on at least one vial at each sample location to ensure the pH is less than 2. The tested vial will be discarded. If the pH is greater than 2, additional HCl will be added to the sample vials. Another vial will be pH tested to ensure the pH is less than 2. The tested vial will be discarded. The vials will be filled so that no headspace occurs. The samples will be chilled to 4°C immediately upon collection. Three vials of each equipment rinsate blank are required for each laboratory.

RAP Metals. Low concentration equipment rinsate and field blanks collected for total metals analysis will be collected in 1-liter polyethylene bottles. The blanks will be preserved by adding nitric acid (HNO_3) to the sample bottle. The bottle will be capped and lightly shaken to mix in the acid. A small quantity of sample will be poured into the bottle cap where the pH will be measured using pH meter. The pH must be less than or equal to 2. The sample in the cap will be discarded, and the pH of the sample will be adjusted further if necessary. The samples will be chilled to 4°C immediately upon collection. One bottle of each equipment rinsate blank is required for each laboratory.

7.3 Sample Traffic Report and Chain-Of-Custody Records, RAP Packing Lists, and QA/QC Summary Forms

Organic and inorganic traffic reports and chain-of-custody records and RAP packing lists are used to document sample collection and shipment to laboratory for analysis. All sample

shipments for CLPAS analyses will be accompanied by a traffic report and chain-of-custody record. All sample shipments for RAP analyses will be accompanied by a packing list. Form(s) will be completed and sent with the samples for each laboratory and each shipment (i.e., each day). If multiple coolers are sent to a single laboratory on a single day, form(s) will be completed and sent with the samples for each cooler.

The traffic report and chain-of-custody record or RAP packing list will identify the contents of each shipment and maintain the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in someone's view, locked up, or kept in a secured area that is restricted to authorized personnel. Until the samples are shipped, the custody of the samples will be the responsibility of BEI. The site leader or designee will sign the traffic report and chain-of-custody record or RAP packing list. The site leader or designee will sign the "relinquished by" box and note date, time, and air bill number.

The white (original) copy of the RAP packing list will be sent to the EPA Region IX Quality Assurance Management Section (QAMS), the yellow (second) copy will go to the Contact Laboratory Analytical Services Support (CLASS) office, and the gold (third) and pink (fourth) copies will accompany the samples to the laboratory. A copy of the original will be made for the BEI master files.

A quality assurance/quality control (QA/QC) summary form will be completed for each laboratory and each matrix of the sampling event. The sample numbers for all rinsate samples, reference samples, laboratory QC samples, and duplicates will be documented on this form (see Section 8.0). The original form will be sent to QAMS; a photocopy will be made for the BEI master files. This form is not sent to the laboratory.

A self-adhesive custody seal will be placed across the lid of each sample. For volatile organic compound samples, the seal will be wrapped around the cap. The shipping containers in which samples are stored (usually sturdy picnic cooler or ice chest) will be sealed with self-adhesive custody seals any time they are not in someone's possession or view before shipping. All custody seals will be signed and dated.

The CLP Paperwork Instructions, Appendix G to the guidelines on *Preparation of a U.S. EPA Region 9 Sample Plan for EPA-Lead Superfund Projects,* will be taken to the field as a reference. Corrections on sample paperwork will be made by placing a single line through the mistake and initialing and dating the change. The correct information will be entered above, below, or after the mistake.

7.4 Photographs

Photographs will be taken at every sample location and at other areas of interest on site. They will serve to verify information entered in the field logbook. When a photograph is taken, the following information will be written in the logbook or will be recorded in a separate field photography log:

- Time, date, location, and, if appropriate, weather conditions

- Description of the subject photographed
- Name of person taking the photograph

7.5 Labeling, Packaging, and Shipment

All samples collected will be labeled in a clear and precise way for proper identification in the field and for tracking in the laboratory. The CLP samples will have preassigned, identifiable, and unique numbers. At a minimum, the sample labels will contain the following information: CLP Case or RAP Number, station location, date of collection, analytical parameter(s), and method of preservation. Every sample, including samples collected from a single location but going to separate laboratories, will be assigned a unique sample number.

All sample containers will be placed in a strong-outside shipping container (a steel-belted cooler). The following outlines the packaging procedures that will be followed for low concentration samples.

1. When ice is used, secure the drain plug of the cooler with fiberglass tape to prevent melting ice from leaking out of the cooler.
2. Line the bottom of the cooler with bubble wrap to prevent breakage during shipment.
3. Check screw caps for tightness and, if not full, mark the sample volume level of liquid samples on the outside of their sample bottles with indelible ink.
4. Secure bottle/container tops with clear tape and custody seal all container tops.
5. Affix sample labels onto the containers with clear tape.
6. Wrap all glass sample containers in bubble wrap to prevent breakage.
7. Seal all sample containers in heavy duty plastic bags. Write the sample numbers on the outside of the plastic bags with indelible ink.

All samples will be placed in coolers with the appropriate traffic report and chain-of-custody forms or RAP packing lists. One temperature blank (i.e., a 40 milliliter vial of distilled water) will be included in each cooler. All forms will be enclosed in a large plastic bag and affixed to the underside of the cooler lid. Empty space in the cooler will be filled with bubble wrap or styrofoam peanuts to prevent movement and breakage during shipment. Vermiculite will also be placed in the cooler to absorb spills if they occur. Ice used to cool samples will be double sealed in two zip lock plastic bags and placed on top and around the samples to chill them to the correct temperature. Each ice chest will be securely taped shut with nylon strapping tape, and custody seals will be affixed to the front, right and back of each cooler.

The EPA Region IX Regional Sample Control Center (RSCC) will be notified daily (phone 415-744-1498) of the sample shipment schedule (Friday shipments must be reported no later than noon) and will be provided with the following information:

- Sampling contractor's name
- The name and location of the site
- Case number or RAP number
- Total number(s) by concentration and matrix of samples shipped to each laboratory
- Carrier, air bill number(s), method of shipment (priority next day)
- Shipment date and when it should be received by lab
- Irregularities or anticipated problems associated with the samples
- Whether additional samples will be shipped or if this is the last shipment.

8.0 QUALITY CONTROL

8.1 Equipment Rinsate and Field Blanks

Equipment rinsate and field blanks will be prepared to evaluate field sampling and decontamination procedures. The equipment rinsate and field blanks will be prepared as described in Section 5.3 and be analyzed for RAP metals and RAP volatile organic compounds. A minimum of one equipment rinsate blank will be collected per matrix per day that sampling equipment is decontaminated in the field. Equipment rinsate blanks will be obtained by passing HPLC-grade water (for organics) and/or deionized water (for inorganics) through or over the decontaminated sampling device.

Blanks will be preserved, packaged, and sealed as appropriate for water samples. A separate CLP sample number and station number will be assigned to each blank, and it will be submitted blind to the laboratory.

8.2 Background (Reference) Samples

The background (reference) samples will be collected in an area which is unlikely to have received contaminants. Background samples are intended to be representative of conditions that exist in the site vicinity. Background samples will be taken in similar geological strata to the other sample locations and at similar depth. Background soil samples will be obtained from sample locations SS-1 and SS-2. Background/upgradient groundwater sample GW-1 will be collected from Flume Well 2.

Background samples will be preserved, packaged, and sealed in the same manner as other samples of the same matrix. A separate CLP sample number and station number will be assigned to each background sample, and it will be submitted blind to the laboratory.

8.3 Duplicate Samples

Duplicate samples are collected simultaneously with a standard sample from the same source under identical conditions into separate sample containers. A duplicate sample is treated independently of its counterpart in order to assess laboratory performance through comparison of the results. At least 10 percent of samples collected per event will be duplicates. At least one duplicate will be collected for each sample matrix. Every analytical group for which a standard sample is analyzed will also be tested for in one or more duplicate samples. Duplicate samples should be collected from areas of known or suspected contamination.:

Duplicate soils samples will be collected at sample locations SS-9, SS-17, and SS-21. Duplicate samples will be collected from these locations because these samples will be collected at locations that are suspected to exhibit the highest concentrations of hazardous substances.

As described in Sections 5.1 and 5.2, soil samples to be analyzed for CLPAS metals will be homogenized with a trowel in a sample-dedicated 1-gallon disposable pail. Homogenized material from the bucket will then be transferred to the appropriate wide-mouth glass jars for both the regular and duplicate samples. All jars designated for a particular analysis (e.g., CLPAS volatile organic compounds) will be filled sequentially before jars designated for another analysis are filled (e.g., CLPAS metals). Soil samples to be analyzed for CLPAS volatile organic compounds will not be homogenized. When collecting duplicate soil samples to be analyzed for CLPAS volatile organic compounds, equivalent portions of sample collected from the same boring will be transferred to both regular and duplicate sample containers.

A duplicate groundwater sample will be collected for groundwater sample number GW-3. A duplicate samples will be collected from this location because sample GW-3 will be collected from Flume Well 6, the agricultural well hydraulically downgradient of the site. Flume Well 6 is the well most likely to have the highest hazardous substance concentrations. When collecting duplicate groundwater samples, bottles with the two different sample identification numbers will alternate in the filling sequence [e.g., RAP volatile organic compounds designation GW-3, RAP volatile organic compounds designation GW-4 (duplicate of GW-3), RAP metals designation GW-3, etc.]

Duplicate samples will be preserved, packaged, and sealed in the same manner as other samples of the same matrix. A separate CLP sample number and station number will be assigned to each duplicate, and it will be submitted blind to the laboratory.

8.4 Laboratory Quality Control Samples

Laboratory quality control (QC) samples are analyzed by the EPA contract as part of the CLP standard laboratory quality control protocols. The laboratory monitors the precision and accuracy of the results of their analytical procedures through analysis of QC samples. In part, laboratory QC samples consist of matrix spike samples and matrix spike duplicate samples. The term "matrix" refers to use of the actual media collected in the field (i.e., routine soil and water samples). Laboratory QC samples are an aliquot (subset) of the field sample. They are not a separate sample but a special designation of an existing sample. A routinely collected soil sample (a full 8-oz. sample jar or two 120-ml sample vials) contains sufficient volume for both routine sample analysis and additional laboratory QC analyses. However, for water samples,

double volumes of samples are supplied to the laboratory for its use. Two sets of water sample containers are filled and all containers are labeled with a single sample number. The laboratory is alerted as to which sample is to be used for QC analysis by notation on the sample container label and the traffic report and chain-of-custody record or SAS packing list.

At a minimum, one laboratory QC sample is required per week or one per 20 samples (including blanks and duplicates), whichever is greater. If the sample event lasts longer than 1 week or involves collection of more than 20 samples per matrix, additional QC samples will be designated. For this sampling event, samples collected at the following locations will be the designated laboratory QC samples:

- For soil, samples SS-10 and SS-20
- For groundwater, sample GW-2

Soil samples SS-10 and SS-20 will be designated as QA/QC samples because they will be collected in areas where suspected levels of contamination are believed to be highest. Groundwater sample GW-2 will be designated as a QA/QC sample because Flume Well 3, the agricultural well hydraulically downgradient of the site, is the well most likely to have the highest hazardous substance concentrations.

8.5 Temperature Blanks

One temperature blank consisting of a 40-milliliter vial of distilled water shall be included in each cooler shipped to the analytical laboratory. The purpose of the temperature blank is to allow the analytical laboratory to obtain a representative measurement of the temperature of samples enclosed in a cooler without disturbing the actual samples. The field sample team will package and label the temperature blank like a regular water sample, however the analytical laboratory will only measure the temperature of the blank. The temperature blank will not be analyzed for hazardous substances.

Temperature blanks shall be labeled T-1, T-2, T-3, etc. The total number of coolers shipped to the analytical laboratory will determine the actual number of temperature blanks prepared.

8.6 Performance Evaluation Sample

One performance evaluation (PE) sample (GW-5) will be submitted to the laboratory as a low level field evaluation sample. The EPA will prepare a water sample containing a known amount of arsenic and PCE and provide the water sample to BEI prior to the sampling event.

Background samples will be preserved, packaged, and sealed in the same manner as other samples of the same matrix. A separate CLP sample number and station number will be assigned to each background sample, and it will be submitted blind to the laboratory.

8.7 Field Variances

As conditions in the field may vary, it may become necessary to implement minor modifications to sampling as presented in this plan. When appropriate, QAMS will be notified of the modifications and a verbal approval will be obtained before implementing the modifications. Modifications to the approved plan will be documented in the ESI Report.

1.0 INTRODUCTION

1.1 Overview

The California Occupational Safety and Health Administration (Cal/OSHA) promulgated standards, Title 8, California Code of Regulations (CCR), Section 5192, "Hazardous Waste Operations and Emergency Response", to protect the safety and health of hazardous waste workers. The OSHA standards, along with the U.S. Environmental Protection Agency (EPA) requirements of the Resource Conservation Recover Act (RCRA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and the Superfund Amendments and Reauthorization Act (SARA) of 1986, and the Bechtel Safety and Health Program form the basis for this site-specific safety and health plan.

Bechtel will comply with rules and regulations applicable to this work and with appropriate guidelines set forth by government and industry consensus groups. The ARCSWEST Site Assessment Project Manager, Project or Deputy Manager (PDM), and Program Safety and Health Manager (PSHM) or their designee will provide the Site Leader (SL) and other field personnel with the support to provide a work environment which will not compromise the safety or health of site personnel, the public, or the environment.

1.2 Applicability

Although this plan is designed to be specific with regard to the planned work activities and potential encounters with identified contaminants, the nature and type of this field work requires a certain amount of flexibility to be incorporated. Unforeseen situations may arise or conditions may change during the course of the work that require deviation and changes in the plan. Changes in the plan will be initiated by the Site Safety and Health Representative (SSHR) and require the approval of the PSHM.

Subcontractors shall be responsible for developing their own Safety and Health Plans for on-site implementation. The subcontractor's Safety and Health Plan may be modeled after the Bechtel Safety and Health Plan and must be at least as stringent. The subcontractor's Safety and Health Plan must be reviewed and accepted by the PSHM or his designee prior to the initiation of any on-site work activity.

Unforeseen safety and health related issues, hazards, or conditions identified at the Guyaux Landfill site shall be reported verbally to the PSHM and the SL by the SSHR promptly. Written addenda to the Safety and Health Plan shall follow as soon as possible for permanent changes in conditions or safety and health requirements.

1.3 Field Activities

This Safety and Health Plan (SHP) covers Bechtel's field sampling effort to gather data as part of an expanded site inspection (ESI) at the Guyaux Landfill site (the site) (CAD 983652033) in Colton, San Bernardino County, Calif. Table 1-1 lists, by task number, the site activities covered this SHP. Minor activities in support of the tasks listed in Table 1-1 are also authorized without revisions to the SHP.

Table 1-1

Contract Field Activity Description

Task #	Description
1.	Mobilization: Assembling of personnel and equipment on site; establishing of site facilities, if needed, such as office and storage trailers, electrical and plumbing services
2.	Soil Sampling: Preparation of sampling sites by clearing, grubbing, or removal of paved surfaces; collection of surface and shallow soil samples (to 10 feet bgs) at approximately 25 locations using hand augers, shovels, and trowels
3.	Groundwater sampling: Groundwater samples shall be obtained from existing agricultural wells
4.	Demobilization: Decontamination and release of equipment, dismantling of site facilities, removal of personnel and equipment from the site

1.4 Organization and Responsibilities

The safety and health management of the sampling activities will be conducted in accordance with ARCSWEST Program Procedure 8.01 and shown in Figure 1-2.

The PDM or designee (Site Leader) is responsible for work activities at the site, and is responsible for Bechtel safety and health compliance. The PDM will also ensure that adequate budget, staff, equipment, and procedures are provided to implement on-site work. The PDM will ensure that the PSHM or designee reviews and approves sampling plans, budgets, and project instructions.

The PSHM leads all ARCSWEST safety and health program efforts, and is responsible for ongoing management of all ARCSWEST safety and health program activities.

The SL and PDM are responsible for the overall safety performance on the project and have the responsibility for implementation of the SHP.

The SSHR reports to the ARCSWEST PSHM concerning on-site safety and health matters. While on-site, the SSHR will coordinate all matters related to safety and health. The SSHR has the authority to:

- Implement and enforce compliance with this Safety and Health Plan.
- Require specific safety and health precautions, such as monitoring, sampling and use of PPE, prior to and during site entry by Bechtel or Bechtel-directed personnel.

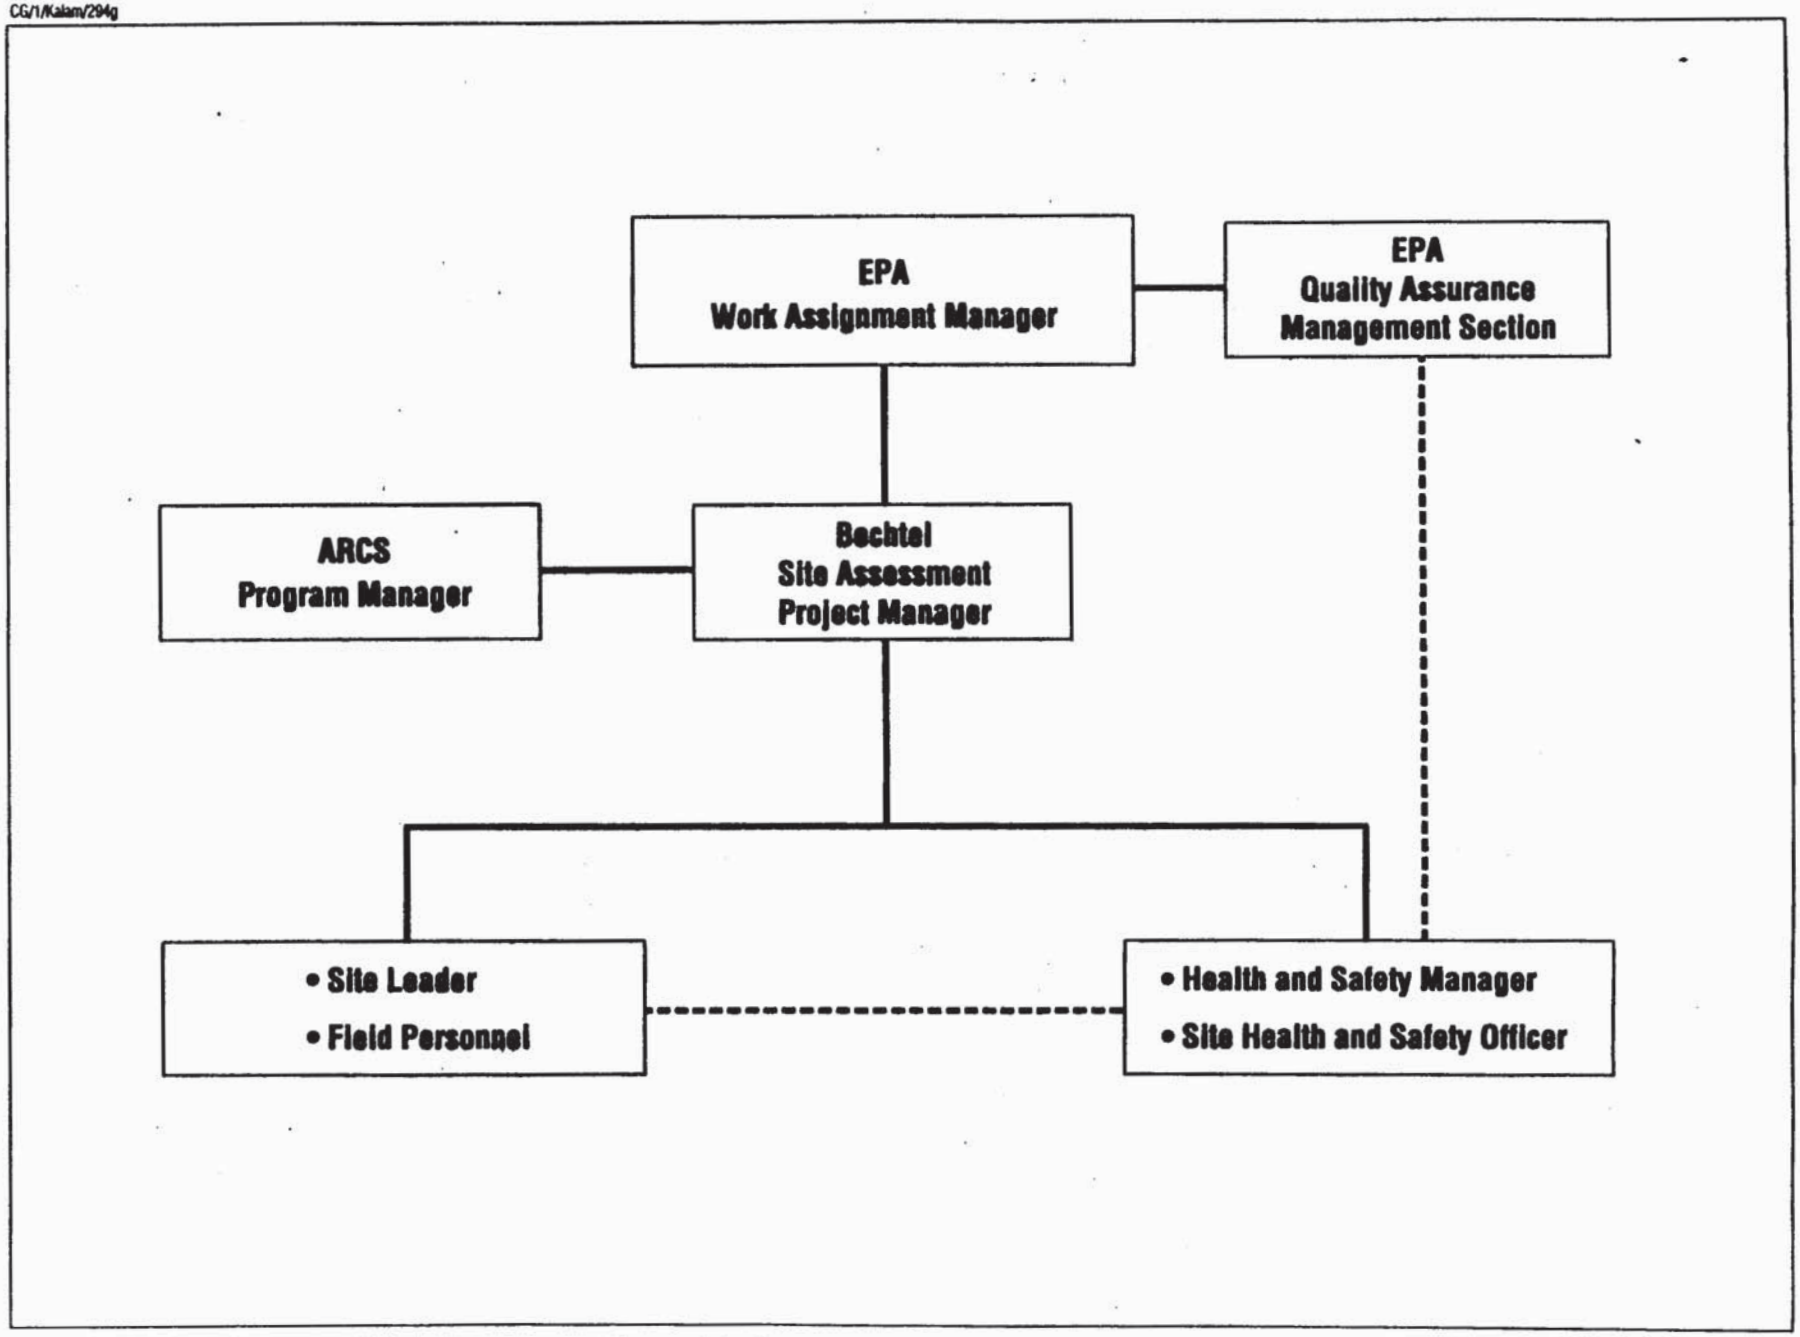

Figure 1-1 Health and Safety Responsibilities

- Require any Bechtel personnel to obtain immediate medical attention if warranted.
- Order the immediate evacuation of Bechtel and subcontractor personnel from any area.
- Stop Bechtel work when the safety, health, and well-being of Bechtel personnel or the environment may be adversely affected.

1.5 General Safety Rules and Requirements

Accident/Incident Reporting All accidents/incidents (near misses, property damage, and personal injury/illness), however insignificant, must be reported, following the stabilization of any resulting emergency conditions, to the SSHR.

Alcohol, Drugs and Firearms Alcoholic beverages, unauthorized narcotics, weapons (loaded or unloaded) will not be permitted within the boundaries of the site. Individuals under the influence of alcohol or drugs shall not be allowed on site. Persons under medical treatment may be allowed to work on site with a written approval from their physician. A copy of the physician's written approval will be filed with the PSHM prior to starting work.

Buddy System The buddy system will be enforced for all work activities performed within any Exclusion Zone (EZ) or Contamination Reduction Zone (CRZ) established on site. There will always be a minimum of two people attending to or present during any given field activity.

Vehicle Safety The following procedures will be followed by all field personnel:

- All drivers of vehicles on-site will have valid drivers' licenses and observe posted traffic ordinances. The maximum speed limit in the work area is 9 mph.
- All vehicles must be driven and parked in authorized areas only.
- Vehicles and equipment used on this project shall be legally registered and/or have valid operating permits.
- All personnel shall wear seat belts while driving or riding as passengers on site.

Smoking, Eating, Drinking or Chewing Personnel shall not engage in smoking, eating, drinking, or chewing gum/tobacco except in areas designated by the SSHR. Designated smoking areas may be identified during site mobilization. There will be NO smoking, eating, drinking or chewing in vehicles or on equipment in the designated work zones.

Horseplay Horseplay will not be tolerated on this project. Personnel will either be warned or removed from the site, depending on the circumstances.

Unsafe Conditions Any person observing an act by another individual or a condition which may jeopardize the health and/or safety of personnel, the environment, or the community on this project will immediately warn others present, then notify the SSHR.

Equipment and Tools Personnel shall maintain tools and equipment in safe working order. Personnel who are unfamiliar with the proper use and safety features of a tool or piece of equipment shall be given thorough instruction before use and close supervision thereafter.

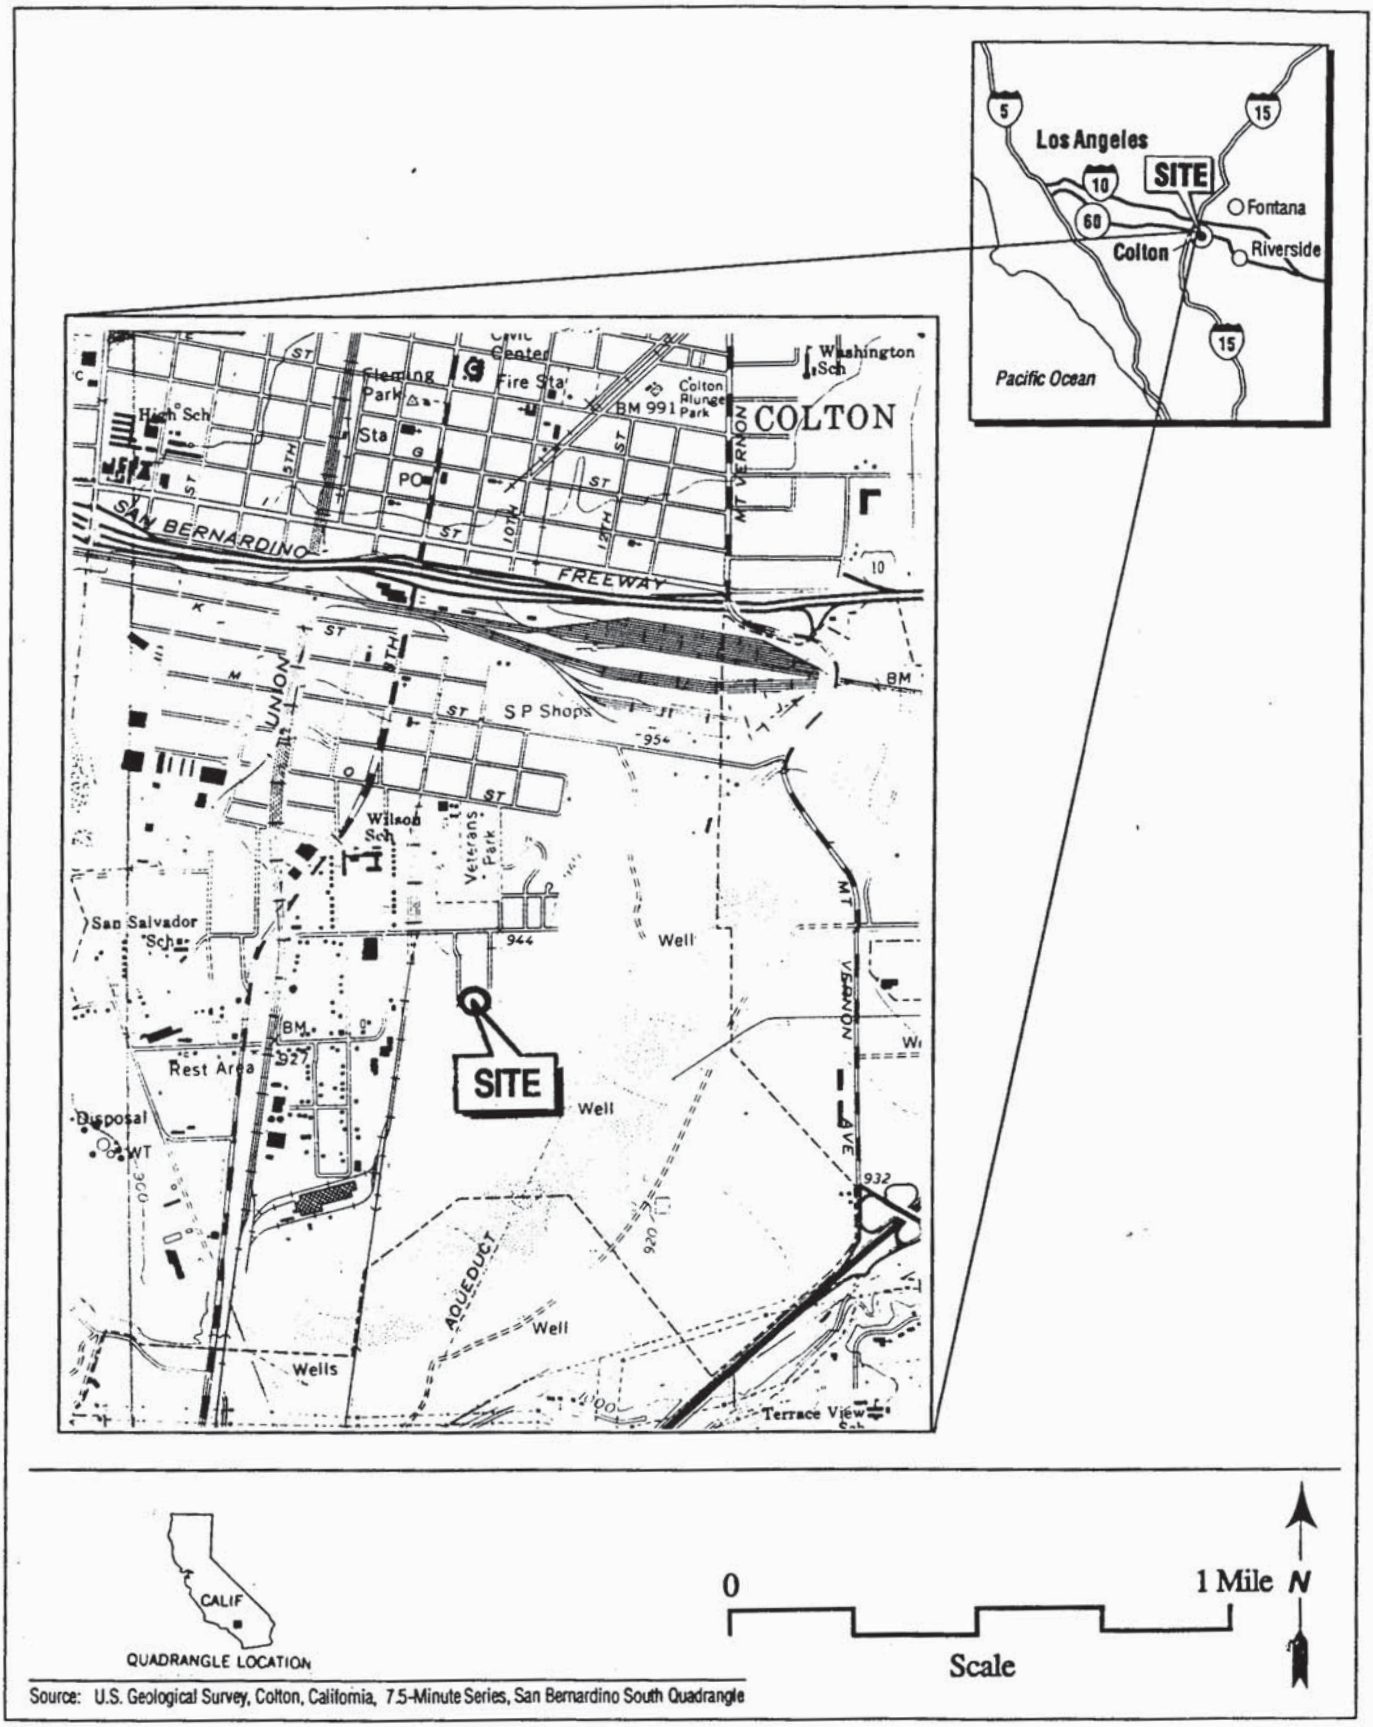
Housekeeping All project grounds, work areas, equipment and vehicles shall be maintained in a clean and safe condition. Areas and surfaces shall be kept free of debris, unnecessary tools and material, and any other items capable of causing slip, trips or falls.

2.0 SITE BACKGROUND

2.1 Location

The Guyaux Landfill site is located at the end of Florez and Fernando streets in Colton, San Bernardino County, Calif. The geographic coordinates for the site are 34° 03' 11.50" N latitude, 117° 19' 15.50" W longitude (Township 1 South, Range 4 West, San Bernardino Baseline and Meridian, San Bernardino South, Calif., 7.5-minute quadrangle). The location of the site is shown in Figure 2-1.

2.2 Site Description



The Guyaux Landfill site is located in an industrial/residential area of Colton, Calif. The site is bordered on the north by residences, on the east and west by vacant land, and on the south by vacant land and the Santa Ana River. The site layout is shown in Figure 2-2.

The site occupies 28 acres. A 6-acre portion in the northern part of the site was used as a landfill sometime between 1930 and 1985. The rest of the site is in a floodplain. The elevation of the former landfill is approximately 15 feet higher than the rest of the site. The entire site is unpaved, unfenced, and covered by vegetation.

During site visits, piles of waste slag were noted along the face and on top of the landfill. Several piles of used tires and pieces of old furniture were also dumped on site. In addition, up to 10 empty 55-gallon drums were on site.

2.3 Operational History

Since 1930, 6 acres of the site have been used as a landfill. In the 1930s, construction debris from the rebuilding of the City of Colton were disposed of in the landfill portion of the site. In the 1950s, the landfill was used for the temporary storage of bricks and other construction materials prior to reuse. In the 1970s and 1980s, the landfill was used as a materials recycling/disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company sites. Waste materials, including plaster molds and broken porcelain from bathroom fixture production from the Crane Company, were deposited on the landfill. In addition, the landfill accepted waste slag from the Griffin Wheel Company. Since 1985, the landfill portion of the site has been used for the temporary storage of cars and machinery prior to dismantling and reuse.

Source: U.S. Geological Survey, Colton, California, 7.5-Minute Series, San Bernardino South Quadrangle

Figure 2-1 Site Location

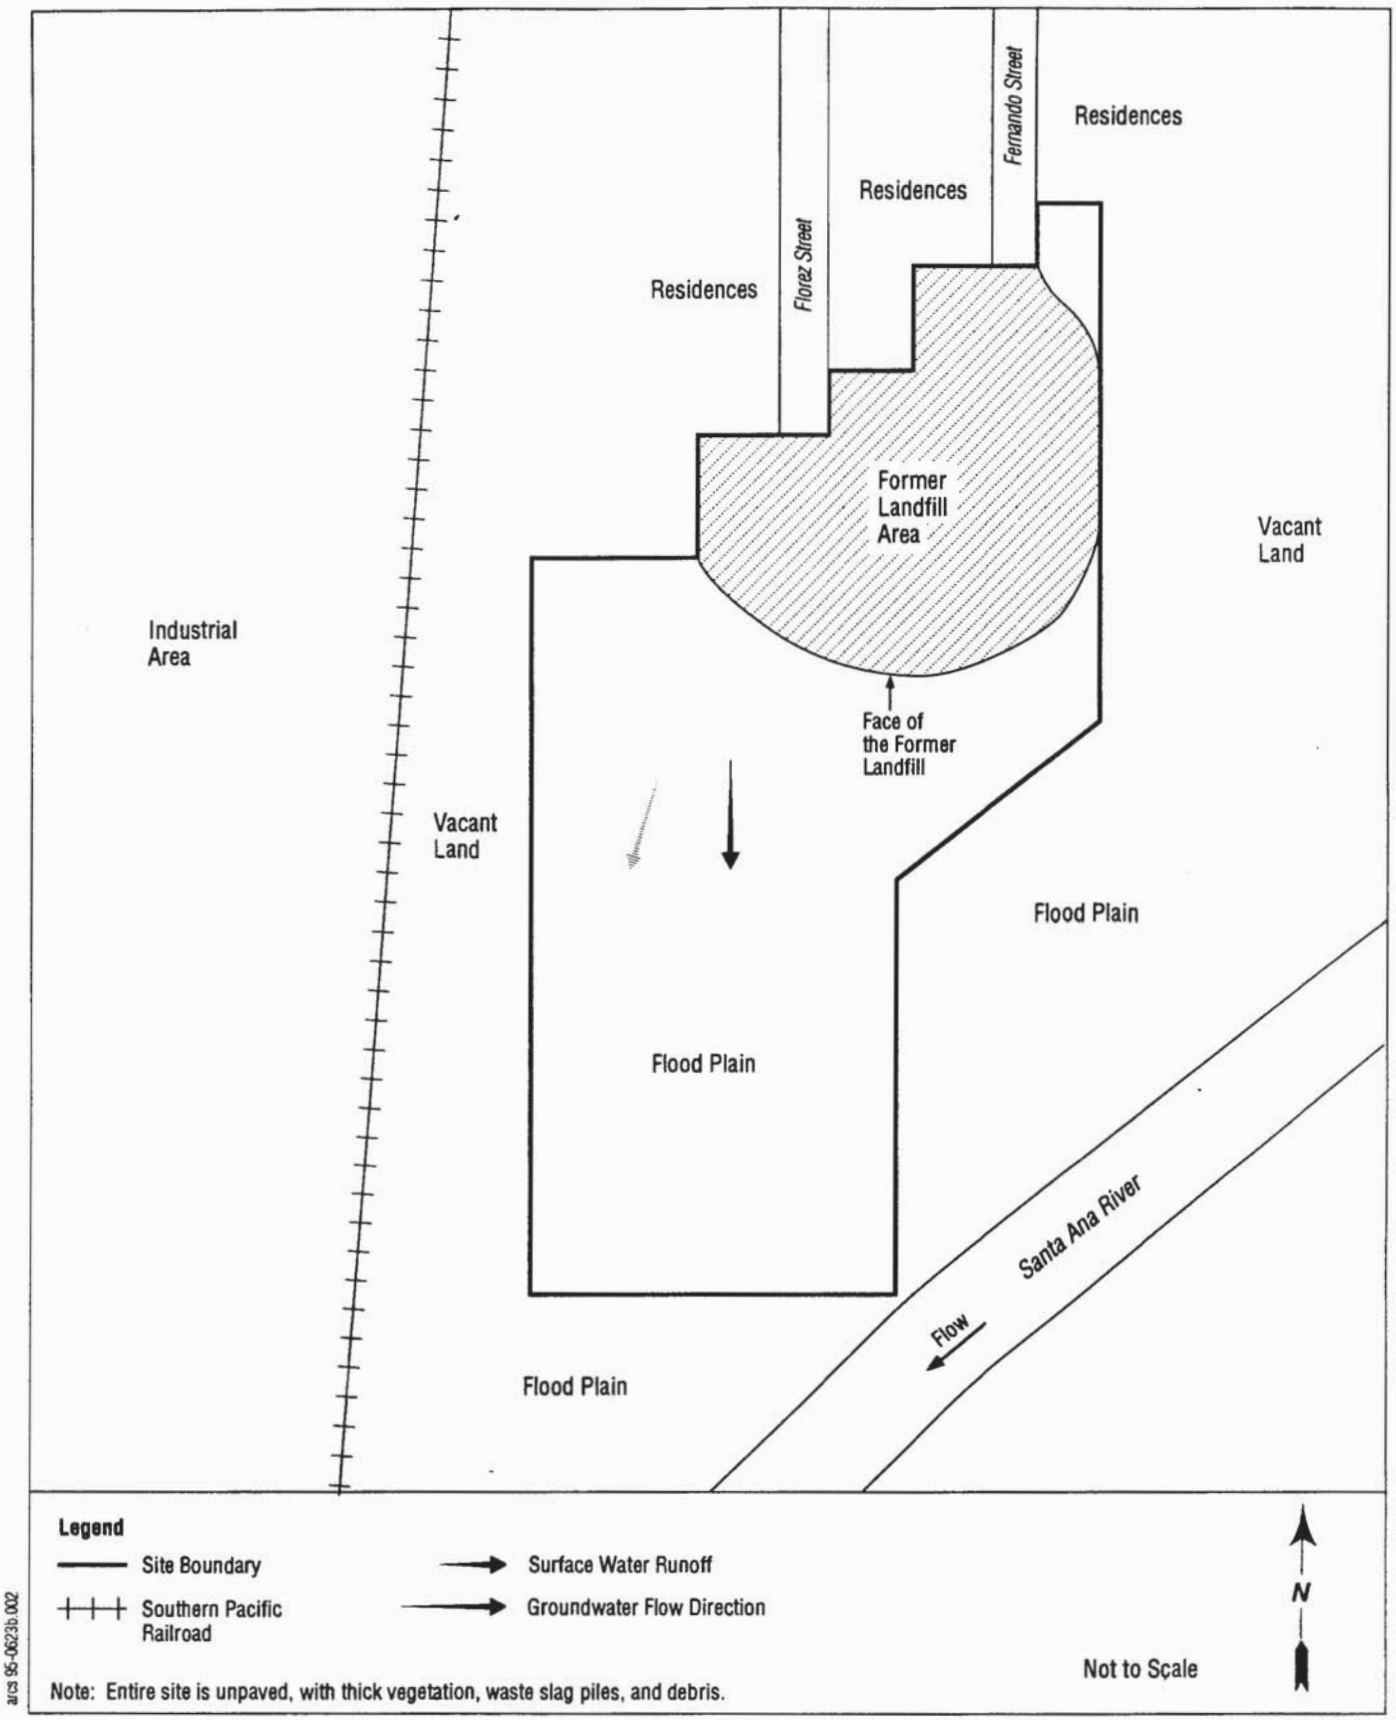


Figure 2-2 Site Layout

2.4 Site Conditions

Waste slag generated at the Griffin Wheel Company was deposited at the Guyaux Landfill site. In 1989, Dames & Moore, contractors to the Griffin Wheel Company conducted a Phase II site assessment at the Griffin site to characterize the waste slag. Eleven soil borings were drilled in the slag pile during this investigation and the samples analyzed for California Code of Regulations (CCR) Title 22 metals. Results of laboratory analyses of the samples indicated the presence of Title 22 metals, including up to 105 milligrams per kilogram (mg/kg) of arsenic, 72.1 mg/kg of cadmium, and 9,520 mg/kg of lead.

In 1989, the Santa Ana Watershed Project Authority (SAWPA) conducted a regional hydrogeological study in the vicinity of the site. As part of this study, monitoring wells screened in a shallow perched groundwater zone (approximately 40 feet to 80 feet below ground surface) were installed. Groundwater samples collected from a downgradient monitoring well (A-2) were analyzed for metals. Information on the analytical methods used are not available. Results of laboratory analyses indicated the presence of metals including arsenic at 18 parts per billion (ppb) and barium at 69 ppb.

In 1993 and 1994, the City of Riverside sampled the agricultural wells in the vicinity of the site. Groundwater samples collected from an agricultural well (Flume 6) downgradient of the site and screened in the drinking-water aquifer were analyzed for metals using EPA Method 6010. Results of laboratory analyses of the groundwater samples indicated the presence of up to 15 ppb of arsenic. A background agricultural well (Flume 2) also screened in the drinking-water aquifer did not contain arsenic above its method detection limit.

2.5 Regulatory Involvement

U.S. Environmental Protection Agency (EPA) The Guyaux Landfill site is not listed in the Resource Conservation and Recovery Information System (RCRIS) database, as of November 22, 1994.

California Environmental Protection Agency, Regional Water Quality Control Board (RWQCB), Santa Ana Region The RWQCB has been involved with the site since 1977. In response to a citizen complaint in 1977, the RWQCB requested that the site owner submit a report of waste discharge (ROWD). In response, an incomplete ROWD was submitted by the site owner to the RWQCB. In 1981, the RWQCB requested that the site owner sample and analyze the waste slag. The site owner did not comply with this request. In 1985, the RWQCB requested a groundwater monitoring network around the site. The site owner did not comply with this request. In 1988, the RWQCB requested a Solid Waste Assessment Test (SWAT) from the site owner. The site owner has not responded to this request.

City of Colton, Community Development Department. (CDD) The City of Colton CDD found the site owner in violation of city property maintenance codes and issued a citation for non-compliance. The city obtained a court order directing the site owner to remove debris from site (i.e., tires, scrap metal, concrete, weeds). The site owner complied with the court order, removing debris and weeds from the site to a municipal landfill. According to the CDD, its action only covers aesthetics, not environmental issues. No environmental sampling or testing is associated with this enforcement action.

3.0 HAZARD ANALYSIS

3.1 Physical Hazards

The potential physical hazards that are associated with this project include those associated with outdoor work activities, such as use of hand tools; vehicle operation; slipping, tripping and falling hazards; temperature extremes that cause sunburn and heat stress due to physical exertion; fire and explosion hazards associated with methane buildup in wells. Many of these items are low probability events with a high severity of injury. Both low probability events and those to which workers are more or less continuously exposed can be avoided with the use of common sense and proper vigilance to the task being performed and to the conditions of the site.

Slips/Trips/Falls The work area may contain various types of equipment or man-made and natural hazards that can pose slipping, tripping and falling hazards. Some of these include uneven terrain, tools and sampling equipment, and debris associated with the landfill. Landfill debris may include sharp and protruding objects having the potential to cause injury. To minimize risks, inspections and housekeeping of the work area will be necessary and shall be conducted every day.

Heat Stress Performing physical activities outdoors may present a risk of developing symptoms of heat-related illness for those who are susceptible. The sampling activities scheduled for the Guyaux Landfill site will be performed in the winter and the risk of heat stress and heat-related illness is therefore primarily limited to use of impermeable and semi-impermeable coveralls and respiratory protection. Heat-related problems are discussed below.

Heat Rash Heat rash is caused by continuous exposure to heat and humid air and aggravated by chafing clothes. The condition decreases the body's ability to tolerate heat and may increase penetration of chemicals through the skin in a hazardous environment.

- Symptoms: Mild red rash, especially in areas of the body that come in contact with protective clothing/gear.
- Treatment: Decrease amount of time in protective gear, and provide powder to help absorb moisture and decrease chafing.

Heat Cramps Heat cramps are caused by perspiration that is not balanced by adequate fluid and electrolyte intake. Heat cramps are often the first sign of a condition that may lead to heat stoke.

- Symptoms: Acute painful spasms of voluntary muscles; e.g., abdomen and extremities.
- Treatment: Remove victim to a cool area and loosen clothing. Have patient drink 1-2 cups of water (preferably supplemented with an electrolyte solution such as Gatorade™) immediately, and every 20 minutes thereafter,

until symptoms subside. Total water consumption should be 1-2 gallons per day. Consult with a physician.

Heat Exhaustion Heat exhaustion is a state of very definite weakness or exhaustion caused by the loss of fluids from the body. This condition is much less dangerous than heat stroke, but it must still be treated.

- Symptoms: Pale, clammy, moist skin, profuse perspiration and extreme weakness. Body temperature is normal, pulse is weak and rapid, breathing is shallow. The person may have a headache, may vomit, and may be dizzy.
- Treatment: Remove the person to a cool, air-conditioned place, loosen clothing, place in a head-low position, and provide bed rest. Consult a physician, especially in severe cases. The normal thirst mechanism is not sensitive enough to ensure body fluid replacement. Have the patient drink 1-2 cups of water immediately, and every 20 minutes thereafter, until symptoms subside. Total water consumption should be 1-2 gallons per day.

Heat Stroke Heat stroke is an acute and dangerous reaction to heat stress caused by a failure of heat regulating mechanisms of the body, i.e., the individual's temperature control system that causes sweating. The body temperature rises so high that brain damage and death will result if the person is not cooled quickly.

- Symptoms: Red, hot, dry skin, although person may have been perspiring earlier; nausea; dizziness; confusion; extremely high body temperature; rapid breathing and pulse, unconsciousness or coma.
- Treatment: Cool the victim quickly. If the body temperature is not brought down quickly, permanent brain damage or death will result. Soak the victim in cool but not cold water, sponge the body with cool water, or pour water on the body to reduce the body temperature to a safe level (102°F). Observe the victim and obtain medical help. Do not give the victim coffee, tea, or alcoholic beverages.

Prevention of Heat Related Illness Proper training and preventive measures will help avert serious illness and loss of work productivity. Preventing heat stress is particularly important because once someone suffers from heat stroke or heat exhaustion, the person may be predisposed to additional heat injuries. To avoid heat stress, a combination of the following preventive measures will be taken as determined necessary by the SSHR:

- Adjust work schedules:
  - Modify work/rest schedules according to monitoring requirements.
  - Mandate work slowdowns as needed.
- Rotate personnel:
  - Alternate job functions to minimize stress or overexertion at one task.
  - Assign additional personnel to work teams.
  - Perform work during cooler hours of the day if possible or at night if adequate lighting can be provided.

- Provide shelter (air-conditioned, if possible) or shaded areas to protect personnel during rest periods.
- Maintain workers' body fluids at normal levels.

This is necessary to ensure that the cardiovascular system functions adequately. Daily fluid intake must approximately equal the amount of water lost in sweat, i.e., 8 fluid ounces (0.23 liters) of water must be ingested for approximately every 8 ounces (0.23 kg) of weight lost. The normal thirst mechanism is not sensitive enough to ensure that enough water will be drunk to replace lost sweat. When heavy sweating occurs, encourage the worker to drink more. A combination of the following strategies will be used to ensure adequate fluid replenishment:

- Maintain water temperature at 50° to 60°F (10° to 15.6°C).
- Provide small disposable cups that hold about 4 ounces (0.1 liter).
- Have workers drink 16 ounces (0.5 liters) of fluid (preferably water or fluids/electrolyte replacement drinks) before beginning work.
- Urge workers to drink a cup or two every 15 to 20 minutes, or at each monitoring break. A total of 1 to 1.6 gallons (4 to 6 liters) of fluid per day are recommended, but more may be necessary to maintain body weight.
- Train workers to recognize and treat heat stress. As part of training, identify the signs and symptoms of heat stress.

Fires and explosions

Potential sources of fires on site include use of solvents during decontamination, operation of vehicles, and possible methane buildup in wells.

General fire prevention can be accomplished by good site preparation, site controls, housekeeping, inspections and monitoring. Clearing of combustible surface debris and material from the work areas and can reduce fire hazard as well as enhance the controllability of a fire should one occur. Smoking and open flames must be strictly prohibited within 20 feet of flammable liquids.

Use and storage of flammable or combustible materials, fuel, or other substances shall be in accordance with Cal/OSHA handling and storage requirements and special procedures set forth by the manufacturer.

The best fire protection (suppression) is the availability and trained use of portable fire extinguishers. All field vehicles and work areas where flammable liquids are used shall have on hand a 5 lb ABC fire extinguisher.

Personnel shall immediately report all fires regardless of size or damages incurred to the SSHR and Site Leader. Personnel shall not attempt to extinguish fires which appear to be out of control.

3.2 Chemical Hazards

Results of laboratory analyses of waste Griffin Wheel Company slag samples collected at the site indicate the presence of elevated concentrations of metals including arsenic, cadmium, and lead. Groundwater sampling has indicated the presence of arsenic. In addition, empty drums and tanks were reportedly disposed of on site: According to nearby residents, drums and containers, some

of them leaking, were disposed of on exposed soil at the Guyaux Landfill site. According to the residents, some of the drums might have been buried.

Table 3-1 provides information regarding the identity and maximum concentration(s) of the contaminants on site. Table 3-1 provides information regarding the physical characteristics, exposure limits, and health hazards associated with those contaminants. In addition to identified contaminants, unidentified contaminants, possibly volatile organic compounds (VOCs), may be encountered at locations where drums and tanks were disposed..

In general, collection of soil and groundwater samples will involve handling of very small volumes of contaminated media and the potential for exposure to significant quantities of contaminants is therefore very low at most sampling locations. However, the Field Sampling Plan for the Guyaux Landfill site specifies that soil samples will also be collected down to 10 feet bgs within suspect source locations such as areas of stained or odorous soil, distressed vegetation, and known or suspected drum and tank disposal locations. The potential for inhalation exposure to unidentified VOCs is more likely to be present in these areas. In addition, exposure through skin contact to unidentified contaminants is also more likely. The SSHR will perform monitoring in accordance with Section 7 and use the personal protective equipment (PPE) specified in Section 6 to ensure that site workers are protected against chemical hazards.

3.3 Environmental Hazards

The following are descriptions of the general biological and meteorological hazards and conditions existing in and around the site area:

Initial site-specific safety and health training will discuss the following potential biological hazards.

Rattlesnakes: One hazard potential is an unexpected encounter with the Western Diamondback Rattlesnake (*Crotalus adamanteus*). This animal, though characteristically dormant during winter months in colder climates, may on rare occasion be found active during the scheduled activities on this site. Its roaming activity is primarily nocturnal but the trend is to seek heat at night when temperatures are lower and seek cooler shady refuge during the hot daylight periods. Care must be taken when turning over objects providing potential refuge or when reaching or stepping in locations where full visual inspection is not possible. In general, this species is non-aggressive and will retreat from predators (including humans) rather than attack. If injected, the venom intermixes in the circulatory system causing coagulation and destruction of the blood-related proteins and may lead to death if untreated. The victim will typically experience intense burning and pain sensations radiating away from the bite locations. First aid should be administered immediately and should include removing the victim from danger, applying a cold pack to the bitten area, sending for medical help keeping the individual calm and immobile, and transporting the victim to a medical facility.

Bees, Wasps, Yellow Jackets, Black Widow Spiders, Scorpions, and Brown Recluse Spiders: These insects present a significant hazard to those individuals sensitized to their bite or sting. Prior to initial assignment on this project, personnel with known allergic responses to insect stings will be identified. The SSHR or his designee will confirm that treatment is accessible before commencement of on-site activities. In all cases, a victim suspected of being stung by a scorpion, or bitten by a black widow or a brown recluse spider, must be transported immediately to the emergency medical facility.

Ticks: Lyme Disease is a spirochete-type bacterial infection which is transmitted to humans and some animals by two species of tick. The deer tick is probably the more prevalent. The female is approximately 0.25 inch long and is black and red in color. Spotted fever is also transmitted to

humans by ticks. Ticks are normally found in wooded and bushy areas. When walking through tall brush areas, periodically check yourself and your co-workers for the presence of any ticks or other insects that can cause vector-borne diseases and illness.

Table 3-1
Contaminants Identified near the Guyaux Landfill Site

Contaminant	Maximum Concentration	Comments
Arsenic	105 mg/kg 18 mg/l	Found in slag samples* Found in hydraulically downgradient groundwater samples
Cadmium	72.1 mg/kg	Found in slag samples*
Lead	9,520 mg/kg	Found in slag samples*

* Slag samples collected at the Griffin Wheel Dump site (Colton, Calif.), a known waste contributor of the Guyaux Landfill site.

Table 3-2
Characteristics of Chemical Contaminants

Contaminant	Exposure Limits and Exposure Routes	Physical Properties	Exposure Symptoms and Actions
Arsenic	0.005 mg/m^3 PEL 9 mg/m^3 IDLH Carcinogen Inhalation, ingestion, skin contact and absorption.	Silver-gray odorless metal; may be present in other inorganic compounds in soil; non-combustible, but slight explosion hazard when dust exposed to flame, incompatible with string oxidizers, bromine azide, and hydrogen gas	Ulceration of nasal septum, respiratory irritation, GI disturbances, hyper-pigmentation of skin, peripheral neuropathy, carcinogen **Eyes:** Irrigate immediately **Skin:** Soap wash immediately **Inhalation:** Remove to fresh air, respiratory support if needed **Ingestion:** Immediate medical attention
Cadmium	0.010 mg/m^3 PEL 5 mg/m^3 IDLH Carcinogen Inhalation, ingestion, skin contact and absorption.	Silver-white, blue tinged odorless, metal; may be in other inorganic compounds in soil; non-combustible, but will burn in powder form; incompatible with strong oxidizers, elemental sulfur, selenium and tellurium	Pulmonary edema, dyspnea, cough, tightness of chest, sub-sternal pain, headache, chills, muscular aches, nausea, vomiting diarrhea, anosmia, emphysema, proteinuria, mild anemia, carcinogen **Eyes:** Irrigate immediately **Skin:** Soap wash immediately **Inhalation:** Remove to fresh air, respiratory support if needed **Ingestion:** Immediate medical attention
Lead	0.050 mg/m^3 PEL 0.030 mg/m^3 AL 5 mg/m^3 IDLH Inhalation, ingestion, skin contact and absorption.	Heavy, blue-gray solid; may be in other inorganic compounds in soil; non-combustible; incompatible with strong oxidizers, hydrogen peroxide and acids	Eye irritation, weakness, lassitude, insomnia, facial pallor, pale eye, anorexia, low weight, malnutrition, constipation, abdominal pain, colic, anemia, gingival lead line, tremor wrist and ankle paralysis, encephalopathy, kidney disease, hypotension. **Eyes:** Irrigate immediately **Skin:** Soap wash immediately **Inhalation:** Remove to fresh air, respiratory support if needed **Ingestion:** Immediate medical attention

Personnel on site may be subject to hazardous meteorological conditions such as wind generated dusts. The wind may potentially cause/create:

- Reduced visibility
- Eye injury

- Exposure to nuisance or contaminated dust

The SSHR will require that the proper level of protection is used for work conducted during dusty conditions.

4.0 SITE WORK ZONES

To reduce the accidental spread of hazardous substances by workers from the contaminated area to the clean area, and/or to protect individuals from potential safety hazards, work zones will be established, as needed, around each sampling location. The establishment of work zones will help ensure that personnel and clean areas are properly protected from contamination resulting from the work activities. The SSHR shall specify PPE requirements, if any, inside the work zones. Once established, the work zones must be identified to all on-site personnel and visitors as exclusion, contamination reduction, and support zones.

4.1 Exclusion Zone (EZ)

The Exclusion Zone (EZ) is the area where contamination does, or is likely, to occur. The primary activity performed in the EZ will be sampling. The area around each sample location or the entire work area (in the case of landfills) may be designated as exclusion zone.

4.2 Contamination Reduction Zone (CRZ)

The Contamination Reduction Zone (CRZ) is the transition area between the contaminated area and the clean area. This zone is designed to reduce the probability that the clean Support Zone (SZ) will become contaminated or affected by other site hazards. The distance between the EZ and the SZ provided by the CRZ, together with decontamination of workers and equipment, limits the physical transfer of hazardous substances into clean areas.

4.3 Support Zone (SZ)

The Support Zone is the location of the administrative and other support functions needed to keep the operations in the EZ and the CRZ running smoothly. Any function that need not or cannot be performed in a hazardous or potentially hazardous area is performed here.

Personnel may wear normal work clothes within this zone. Potentially contaminated clothing, equipment, and samples must remain in the CRZ until decontaminated.

Support Zone personnel are responsible for alerting the proper agency in the event of an emergency. All emergency telephone numbers, change for the telephone (if necessary), evacuation route maps, and vehicle keys should be kept in the SZ.

5.0 DECONTAMINATION PROCEDURES

The sampling crew will decontaminate their equipment between work locations per Section 5.5 of the Field Sample Plan . Personal protective equipment and personnel will be decontaminated when each work task is completed.

As a minimum, soap/detergent, rinse water, towels, wash pans, and brushes for scrubbing boots (unless disposable booties are used) will be available. Any wastes generated from decontamination will be packaged and disposed of in accordance with proper procedure. After daily field work has been, completed, all outer protective clothing will be removed, and placed in plastic bags. The decontamination procedure is detailed below (see Figure 5-1 for the decontamination setup).

The following are decontamination procedures:

1. Decontaminate equipment used equipment on site as described in the Field Sample Plan (tools, sampling devices and containers, monitoring instruments, clipboards, PPE, etc.) and deposit on plastic drop cloths. Segregation at the drop reduces the probability of cross-contamination.

2. Remove hard hat. Scrub outer gloves and rubber boots (or boot covers) with detergent and water. Rinse copiously with uncontaminated water.

3. Remove outer boots/booties and gloves. Decontaminate and discard gloves and booties.

4. Remove and discard Tyvek™ suit, if worn. If contaminated, discard as trash after decontaminating, cutting into three pieces, and bagging.

5. Remove respirator and decontaminate. Avoid touching face with fingers when removing.

6. Remove inner gloves.

Note: A portable eyewash system, capable of 15 minutes continuous flow, utilizing dual stream water flow will be available at each location where corrosive chemicals may be present. Eating, drinking, smoking, or chewing gum or tobacco are prohibited prior to decontamination.

All personnel, clothing, equipment, and sample containers leaving the EZ must be decontaminated. Personnel and PPE decontamination will be done using a soap and water wash followed by clean water rinse to remove any sampling-related contamination.

In many cases, gross contamination can be removed by physical means involving dislodging/displacement, rinsing, wiping off, and evaporation.

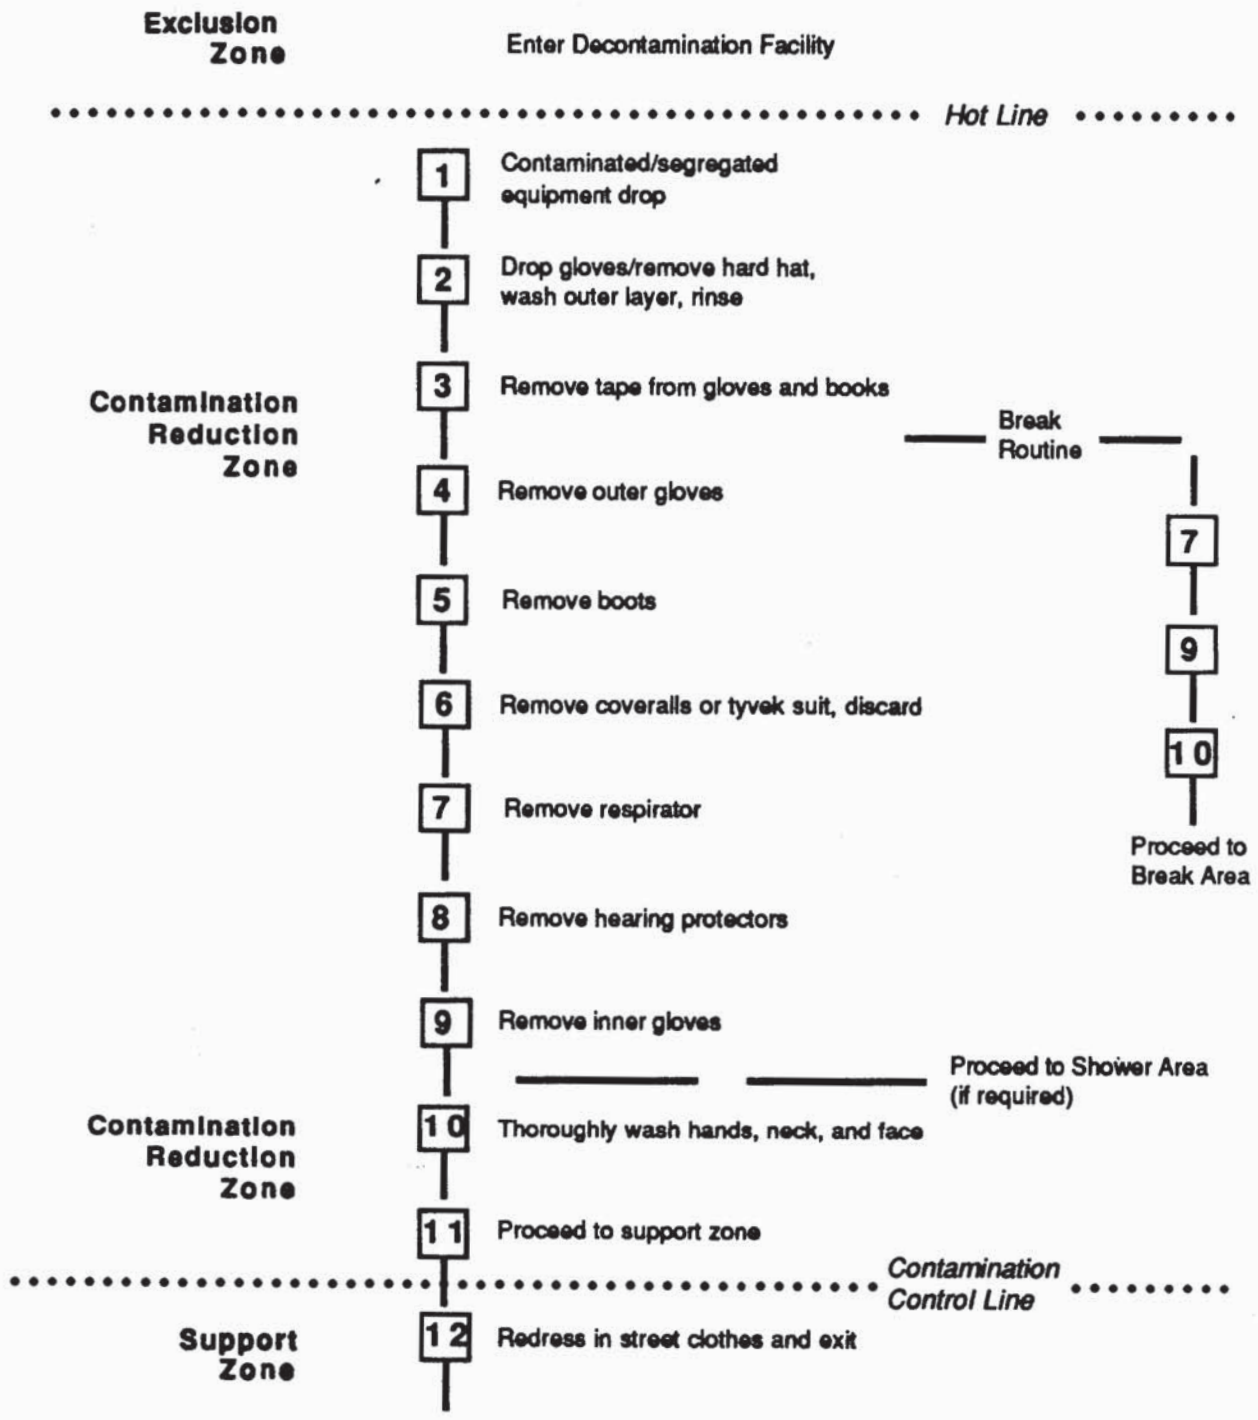

Figure 5-1 Decontamination Procedure

6.0 PERSONAL PROTECTIVE EQUIPMENT

Personal protective equipment can reduce the possibility of contact with hazardous materials, but it should be used in conjunction with proper site entry protocols and other safety considerations. No single combination of protective apparel and equipment is capable of protecting against all hazards. The use of protective apparel and equipment can create significant worker hazards (e.g. heat stress; physical and psychological stress; impaired vision, mobility, and communications). For any given situation, apparel and equipment will be selected to provide a level of protection commensurate with the degree of hazard (see Table 6-1). Overprotection, as well as under protection, can be hazardous and must be avoided.

Modified Level D Modified Level D is for use when toxic substance(s) are known and likely to present a skin hazard, and activities present no potential for significant airborne exposures. This level of protection includes the following protective apparel and equipment:

- Hard hat (Worn in **all** work areas)
- Eye protection (Worn in **all** work areas) (e.g., safety glasses, goggles, and/or face shield)
- Cotton coveralls, uncoated Tyvek™ suits, or polycoated Tyvek™ suits
- Rubber boots
- Nitrile Gloves (May be used with or without cotton or Kevlar glove liners)

Modified Level D protection does not require ports (e.g., wrists, ankles) to be taped unless determined necessary by the Site Safety and Health Representative.

Level C. Level C will be required (see Table 6-1) when potential exposure to airborne contaminants is probable while performing the work activities. This level of protection will include the following:

- NIOSH/MSHA approved Air Purifying Respirator (APR) with Organic Vapor/HEPA Filter Cartridge
- Tyvek™ (uncoated) or Polycoated Tyvek
- Additional elements as required in Modified Level D

7.0 EXPOSURE MONITORING

The potential exists for exposure to airborne contaminants during the work activities. The SSHR or his designee will visually inspect work sites for visible dust concentrations. Contaminant concentrations in soils are expected to be at concentrations such that preventing noticeable dust evolution should be sufficient to ensure that personnel exposures are minimized.

In the event that visible dust emanations are not preventable, breathing zone levels will be measured using a MIE Mini-Ram Dust/Aerosol monitor. Sampling using sampling train for pesticides consisting of a calibrated constant-flow pump and mixed-cellulose ester (MCE) filter

Table 6-1
Personal Protective Ensemble
Soil and/or Groundwater Sampling

Work Location	Job Function	Level	Respiratory	Face	Skin, Outer
On site	Mobilization, Set-up, Demobilization	D	None	Safety glasses	Work gloves; general work clothes
All onsite locations	Surface soil sampling	Modified D	Dust mask	Safety glasses	Nitrile gloves; polycoated Tyvek coveralls
		C	Half- or full-face air-purifying respirator with organic vapor/HEPA cartridge	Same	Same
All onsite locations	Groundwater sampling	Modified D	Dust mask	Safety glasses and splash shield	Nitrile gloves; polycoated Tyvek coveralls, tape openings
		C	Half- or full-face air-purifying respirator with organic vapor/HEPA cartridge	Same	Same
Equipment decon station	Deconing equipment	Modified D	None	Safety glasses and splash shield	Nitrile gloves; polycoated Tyvek coveralls, tape openings

Printed on 50% recycled paper.

may be conducted if total dust concentrations exceed 2 mg/m^3. Particulate samples would be analyzed for arsenic, cadmium, and lead. In addition, if drums or other containers of potentially hazardous VOCs are encountered. The SSHR shall require air monitoring using a flame or photo-ionization detector (FID or PID). Respiratory protection will be mandatory until receipt of analytical data, which will then be used by SSHR to determine if a downgrade in personal protective equipment levels is appropriate.

7.1 Periodic Monitoring

Dust monitoring will be conducted during the work process at each location to document zero exposure and as a safety precaution. If the work zone dust levels in the breathing zone (around the head area) become noticeable and are sustained for more than one (1) minute, the following steps shall be taken:

- Leave the area immediately and don respirator with HEPA cartridges, if not wearing one
- Perform measurements for total dust
- Document concentration levels
- Continue work activities wearing air purifying respirator with appropriate cartridges (see Table 6-1) if dust monitoring results indicate such need.

Monitoring for VOCs, using a FID or PID, shall be performed if drums or other containers are encountered, or if other signs of VOC contamination such as organic odors or soil staining are observed. If such conditions occur, the following steps shall be taken:

- Stop work, leave the area, and don an air purifying respirator with Type GMC-H or organic vapor cartridges, if not wearing one
- Perform measurements for VOCs and document the results
- If levels exceed 1 ppm, but are less than 20 ppm, continue the use of air purifying respirators and collect air samples to identify the contaminant(s). If levels exceed 20 ppm, the work area must be evacuated until air samples are analyzed and the contaminant(s) identified, and the proper level of respiratory protection is available for use.

7.2 Personal Sampling

Personal sampling may be conducted if particulate levels exceed 2 ppm or unknown VOC levels exceed 1 ppm. Personal monitoring may also be conducted, even though the probability of exposure will be low, for documenting representative personal exposures during the work effort. Collection of particulate samples would use a MEC filter and calibrated personnel sampling pump at a rate of 2 L/minute. Levels of arsenic, cadmium, and lead, would be determined in accordance with NIOSH Measurement Methods 7900, 7048, and 7082, respectively. Levels of VOCs would be determined using a charcoal sorbent tube and calibrated personal sampling pump at a rate of 0.2 L/minute. Levels of VOCs would be determined by gas chromatography/mass spectrometer scan.

7.3 Temperature-Induced Stress Monitoring

Wearing PPE puts a hazardous waste worker at considerable risk of developing heat stress. This can result in health effects ranging from transient heat fatigue to serious illness or death. Heat stress is caused by a number of factors, including environmental conditions, clothing; work load, and the individual characteristics of the worker. Because heat stress is probably one of the most common (and potentially serious) illness at field sites, regular monitoring and other preventive precautions are vital.

For workers wearing semi-impermeable or impermeable clothing (i.e., Poly-coated Tyvek™ suits), the ACGIH standard cannot be used. For these situations, workers should be monitored when the temperature in the work area is above 70°F (21°C).

When monitoring the worker or when self-monitoring, the procedures listed below will be followed:

- Heart rate. Count the radial pulse during a 30-second period as early as possible in the rest period.
- If the heart rate exceeds 110 beats per minute at the beginning of the rest period, shorten the next work cycle by one-third (1/3) and keep the rest period the same.
- If the heart rate still exceed 110 beats per minute at the beginning of the following work cycle by one-third (1/3).

Rest periods are dependent on the worker's ability to perform under stress, the temperature, the level of protection, and the level of activity. Each worker is responsible for self-monitoring as well as looking out for their co-worker when heat stress conditions occur. Table 7-1 can be used to determine monitoring frequency. This table will be used to determine the initial frequency when work/rest scenario, monitoring of pulse and temperature will determine future rest periods.

Care will be taken to prevent saturation of clothing during wet and cold periods. Site personnel will be encouraged to carry extra dry clothing for use should such saturation occur, either by exposure to precipitation or contact with surface waters during sampling activities. Monitoring of self and buddy for signs of hypothermia will be undertaken continuously during such periods. Work/Warming regimens will be established and enforced by site safety during periods of cold in accordance with guidelines published by the American Conference of Governmental Industrial Hygienists (ACGIH).

7.4 Combustible Gas Monitoring

Planned field activities include acquisition of groundwater samples at existing agricultural wells. Because of the potential explosion hazard due to methane buildup, the SSHR shall require that combustible gas and percent oxygen measurements be performed as each well is opened. Combustible gas and percent oxygen measurements will be performed using a combustible gas, or multigas meter having a combustible gas sensor. If the combustible gas level exceeds 10% of the lower explosion limit (LEL), work will be stopped and purging lowers the concentration to less than 10% LEL.

7.5 Monitoring Instruments

It is imperative that personnel using monitoring instruments be thoroughly familiar with their use, limitations, and operating characteristics. All instruments have inherent constraints in their ability to detect and/or quantify the hazards for which they were designed. The following equipment is listed along with required or contingent indication:

- MIE Mini-Ram Aerosol/Dust Monitor with Z-Bag Calibration System (required)
- OVA FID or HNu PID or equivalent VOC detectors (contingent)
- Combination combustible gas (% LEL) and O_2 meter (contingent)
- Personal sampling pumps, calibrators, and MEC filter and sorbent tube collection media (contingent).

8.0 RESPIRATORY PROTECTION PROGRAM

On-site work activities may require personnel to wear respiratory protection equipment.

8.1 Respirator Selection

All respiratory protective equipment used on this project will have current NIOSH/MSHA certification for environments or contaminants for which such respirator use is prescribed in this Safety and Health Plan.

Respiratory protection equipment which may be required on the site project include:

- Half- or full-face piece air purifying respirator with HEPA filter (Type H), if levels exceed the 2.0 mg/m^3 (action level for Total Dust), or combination HEPA filter/organic vapor cartridge if unknown VOCs are encountered

8.2 Respirator Fit Testing

All individuals must have documentation that they have been fit tested and trained to wear a respirator.

8.3 Special Concerns

Facial hair can prevent or disrupt the seal between the respirator face piece and the user's skin. The respirators will not be worn when any condition prevents a good seal of the face piece to the face. Beards, mustaches, sideburns, and stubble which interferes with the seal will not be permitted. Employees who wear prescription eyewear shall be provided the manufacturer's spectacle inserts for the full-face piece respirator they are assigned.

Table 7-1
Frequency of Physiological Monitoring for Fit and Acclimated Workers[a]

Adjusted Temperature[b]	Normal Work Ensemble[c]	Impermeable Ensemble
	After Each:	After Each:
90°F (32.2°C) or above	45 minutes of work	15 minutes of work
87.5 - 90°F (30.8 - 32.2°C)	60 minutes of work	30 minutes of work
82.5 - 87.5°F (28.1 - 30.8°C)	90 minutes of work	60 minutes of work
77.5 - 82.5°F (25.3 - 28.1°C)	120 minutes of work	90 minutes of work
72.5 - 77.5°F (22.5 - 25.3°C)	150 minutes of work	120 minutes of work

Notes:

(a) For work levels of 250 kilocalories/hour.

(b) Calculate the adjusted air temperature (T_a adj) by using this equation:
T_a adj (°F) = T_a (°F) + (13 x % sunshine/100).
Measure air temperature (T_a) with a standard mercury-in-glass thermometer with the bulb shielded from radiant heat. Estimate the percent sunshine by judging what percent time the sun is not covered by clouds that are thick enough to cast a shadow. (100% sunshine = no cloud cover and a sharp, distinct shadow; 0% sunshine = no shadow).

(c) A normal work ensemble consists of coveralls or other cotton clothing with long sleeves and pants.

8.4 General Limitations for Respirator Use

The following criteria will be followed:

- **Immediately Dangerous to Life or Health** Air-purifying respirators **shall not be used** in Oxygen Deficient Atmosphere environments (atmospheres containing less than 19.5 percent oxygen at sea level) or in unknown contaminant concentration environments, or in contaminated atmospheres in which the contaminant concentration exceeds 10 X the PEL (50 for full-face piece) or the limit printed on the respirator cartridge label.
- **Eye irritation** When working in contaminated environments or where there is potential for eye irritation, a full-face unit will be used.
- **Warning Properties** Air purifying respirators shall not be used in atmospheres with poor or no warning properties.

9.0 EMERGENCY PLAN

Upon arrival at the site, a staging area and the nearest telephone will be determined. The basis for the selection of the staging area will be its proximity to the work locations and telephone for calling emergency services. In an emergency, all personnel (except medical) will evacuate to the staging area. The nearest medical facility is Loma Linda Community Medical Center (see Table 9-1). Site personnel will be given directions to the hospital before commencing work activities and a map to the hospital shall be posted (see Figure 9-1). Injured personnel should be treated following standard life support and first aid practices and evacuated at the same time as other personnel.

When necessary to warn personnel, a series of short blasts of the vehicle's horn will be adequate.

The work team will carry first aid kits, decontamination solutions, and water.

When calling for emergency assistance, provide the following information to the response agency:

1. Name of the person making the call
2. Telephone number you are calling from and your location
3. Nature of the emergency and the type of assistance needed
4. Actions already taken
5. Other response agencies notified
6. Name of any persons injured or exposed
7. Chemicals (agents) involved, if known

Wait for the response agency to ask questions prior to terminating the call.

3. Turn left (north) on Fogg Street and drive 0.4 mile to M Street.
4. Turn east (right) on M Street and drive 0.4 mile to Mt. Vernon Avenue.
5. Turn south (right) on Mt. Vernon Avenue and drive 1 mile to Washington Street.
6. Turn east (left) on Washington Street, drive over freeway overpass, and continue 1 mile down Washington Street to Barton Road.
7. Make slight left turn onto Barton Road and drive 2.5 miles east to Loma Linda Community Medical Center. The medical center is at the southeastern corner of Barton Road and Benton Street.

THE MEDICAL CENTER IS FULLY EQUIPPED TO HANDLE ALL MEDICAL EMERGENCIES

Loma Linda Community Medical Center
25333 Barton Road

10.0 TRAINING REQUIREMENTS

Bechtel personnel and subcontractors accessing this site will be currently trained per the HAZWOPER requirements of T8 CCR Section 5192 "Hazardous Waste Operations and Emergency Response."

Prior to working, a pre-departure safety and health review will be conducted to ensure that employees assigned to perform work at the site clearly understand the unique hazards and requirements associated with the site. Main topics of the training session will include:

- Site safety and health plan review
- Safety and health hazards associated with the site and sampling
- Work practices by which employees can minimize risks from hazards
- Medical surveillance requirements and recognition of overexposure symptoms
- Decontamination, site control, and emergency procedures
- Use of appropriate personal protective equipment and engineering controls

All personnel assigned to conduct on-site activities will have received training as specified in T8 CCR, Section 5192. The PSHM will conduct the predeparture briefing and any additional training required.

The SSHR will conduct an initial a kickoff Site Safety Meeting prior to the start of field work to review decon setup and procedures; work zone delineation; and emergency procedures. Documentation of such training topic(s) covered, instructor's name, and personnel who attended the training will be maintained in the site log, and a copy will be submitted to the Bechtel ARCSWEST PSHM upon returning from the field. Periodic meetings may be required if the job exceeds five (5) days in length.

Figure 9-1 shows the route to the Loma Linda Community Medical Center from the Guyaux Landfill site.

11.0 MEDICAL SURVEILLANCE

Medical surveillance will be conducted in compliance with ARCSWEST Program Procedure 8.03. Personnel required to work on-site will have been provided an annual baseline health assessment prior to participating in on-site activities, and have a current physician's statement on file with the ARCSWEST PSHM. Medical surveillance programs are established to monitor and document workers' health during Bechtel project activities, and are a major component of the Safety and Health Program. All on-site Bechtel personnel are actively participating in the Bechtel Medical Surveillance Program, and are medically qualified to conduct the required work.

12.0 HAZARD COMMUNICATION

The SSHR is responsible for:

- Maintaining an effective hazard communication program
- Maintaining a site chemical inventory
- Maintaining the MSDSs for all chemicals used on site

- Obtaining only properly labeled containers and labeling secondary hazardous materials containers.
- Identifying non-routine and emergency situations related to chemical use.
- Informing other contractors of the hazardous materials used on site and the potential hazards.

The SSHR will provide hazard communication training to all site personnel prior to start of work and when new chemicals are brought to the site, which will include:

- Basic hazard communication program requirements
- Label interpretation
- Physical and health hazards of the materials on site
- Emergency response
- Content and location of MSDSs

Training will be documented in the Project Site log.

SPECIAL ANALYTICAL SERVICES

Client Request

_____ Regional Transmittal _____ Telephone Request

A. EPA Region/Client: Region 9

B. Region Contact: Gail Jones, EPA (415) 744-1498 ~~Jane Anderson, ESAT, (415) 882-3069~~

C. Date of Request: January 22, 1996

D. Site Name: Guyaux Landfill

E. City/State Colton, CA

F. 2 Digit Superfund Site Identifier:

Please provide below a description of your request for Special Analytical Services under the Contract Laboratory Program. In order to most efficiently obtain laboratory capability for your request, please address all applicable questions. Incomplete or erroneous information may result in a delay in the processing of your request. If you need to provide additional information not addressed by the questions, please attach additional sheets of paper.

1. General description of analytical service requested:

The analysis of low ~~to medium~~ concentration ~~soil~~ water samples for Arsenic ~~and Mercury~~ only following the RAS Inorganic CLP 3/90 SOW, or current revision. Detection limit of 5 micrograms per liter (ug/L) or less is required.

2. Definition and number of work units involved (specify whether whole samples or fraction; whether organics or inorganics; whether aqueous or soil and sediments; and whether low, medium or high concentration):

low concentration aqueous samples

3. Purpose of analysis (specify whether Superfund [enforcement or remedial action], RCRA, NPDES, etc.):

Superfund enforcement

4. Estimated date(s) of collection (provide a sampling schedule):

March 15, 1996

5. Estimated date(s) and method of shipment:

Federal Express - shipped same day as collection for next day delivery.

6. Number of days analysis and data required after laboratory receipt of samples:

Contract required analysis holding time is 180 days for Arsenic ~~and 28 days for Mercury~~ from the date of sample receipt by the laboratory.

Data packages and all other deliverables are required within 35 days from receipt of last sample in each Sample Delivery Group (SDG). A SDG is defined as all samples received within a 14 day period or 20 samples, whichever is reached first.

7. Analytical protocol required (attach copy if other than a protocol currently used in this program):

Follow the RAS Inorganic CLP 3/90 SOW for Inorganics, with the following provision:

a. The samples are to be analyzed for Arsenic and Mercury only following the RAS Inorganic CLP 3/90 SOW.

8. Special technical instructions (if outside protocol requirements, specify compound names, CAS numbers, detection limits, etc.):

a. Calibration Procedure and Criteria: Follow the RAS Inorganic CLP 3/90 SOW. Laboratory is to perform initial instrument calibration using an initial calibration standard containing arsenic at a concentration of 5 ug/L or less.

b. Internal Quality Control Checks, Control Limits and Corrective Actions: Follow the RAS CLP 3/90 SOW for Inorganics.

9. Analytical results required (if known, specify format for data sheets, QA/QC reports, Chain-of-Custody documentation, etc.) If not completed, format of results will be left to program discretion.

a. Data Calculations and Reporting Units: Follow the RAS CLP 3/90 SOW for Inorganics.

b. **Documentation and Deliverables**: Follow the RAS CLP 3/90 SOW for Inorganics, or the most recent revision to the Inorganic SOW.

10. **Other (use additional sheets or attach supplementary information, as needed):**

Attached is a copy of the "U. S. EPA Region 9 Laboratory QC Summary Report" form. This form is to be completed by the Laboratory Manager or his/her designee and submitted with each data package. The form is to reflect the conditions contained within the data package with which it is submitted. Laboratories may make additional copies of this form as needed.

11. **Name of sampling/shipping contact:** Gregory R. Carroll

Phone: (415) 768-6496

12. **Data Requirements:**

Parameter	Detection Limit
Arsenic	as per RAS 3/90 SOW 5 micrograms per liter (ug/L) or les
~~Mercury~~ e	~~as per RAS 3/90 SOW~~ e

13. **QC Requirements:**

QC Required	Frequency of QC	Limits (% or Conc.)
as per RAS 3/90 SOW		

14. **Action required if limits are exceeded:**

Follow RAS CLP 3/90 SOW for Inorganics.

U. S. EPA REGION 9
LABORATORY QC SUMMARY REPORT
INSTRUCTIONS

1. A separate form is to be completed and attached to the Regional copy (original) of each data package submitted. This form is to be placed directly behind the case narrative.

2. The Laboratory QC Summary Report form is to be completed by the Laboratory Manager, or his/her designee.

3. This form will be used to identify areas of non-compliance with the required QC limits that may result in resampling or reduction in payment.

4. Answers to questions are designed so that a YES answer indicates compliance and requires no further explanation. A NO answer indicates non-compliance and requires a short explanation. If a lengthy explanation is required (or desired), write <u>See Case Narrative</u> in the blank space and include the explanation in the case narrative.

U. S. EPA REGION 9
LABORATORY QC SUMMARY REPORT

LABORATORY: _____ SAS #: _____

SUBMITTED BY: _____ # SAMPLES: _____

TITLE: _____ MATRIX: _____

DATE: _____

ANALYSIS: ARSENIC and MERCURY by RAS INORGANIC CLP 3/90 SOW

QC SUMMARY TABLE

QC PARAMETER	QC LIMITS	FREQUENCY
Laboratory Blank	<CRDL for both analytes	1 per SDG (1/20)
Initial Calibration (%RSD)	Correlation Coefficient of ≥0.995 for both analytes	as needed
Calibration Verification (%R)	90 - 110% Recovery for both analytes	Beginning of each day & after each 10 samples
Matrix Spike (%R)	75% - 125%	1 per SDG (1/20)
Lab. Duplicate (RPD)	<±20%	1 per SDG (1/20)
Lab. Control Sample (%R)	80% - 120%	1 per SDG (1/20)

1. Were all samples analyzed within the contract required and technical holding times as listed below:

Arsenic 180 days from sample receipt YES NO
~~Mercury 28 days from sample receipt YES NO~~

a. If no, how many samples were analyzed outside of the holding time?

_____

b. How many days outside of the holding time were these samples analyzed? _____

3. Were all samples received intact and in good condition? YES NO

4. Was the data package sent within 35 days from the receipt of the last samples in the SDG? YES NO

   a. If no, how many days late was the data package sent?

   _____

5. Was the RAS Inorganic CLP 3/90 SOW used to analyze these samples? YES NO

   a. If no, specify which method was used.

   _____

   b. If no, why was this method used? Who authorized its use?

   _____

   c. Was the approved method followed without modifications or deviations? YES NO

   d. If no, specify what the modification or deviations were and who approved them.

   _____

6. Was an Initial Calibration Curve run? YES NO

   a. If yes, when? _____

   b. If no, why not? _____

7. Did the Initial Calibration curve meet the QC requirement of ≥ 0.995 correlation coefficient for both analytes? YES NO

   a. If no, specify analyte(s) and correlation coefficient(s) that were outside of the QC limits.

   _____

8. Was a Calibration Verification standard run at the beginning of each day? YES NO

After every 10 samples? YES NO

a. If no, why not? _____

9. Did the Continuing Calibration standards meet the QC requirement of <±10% R for all analytes? YES NO

a. If no, specify analyte(s) and %R(s) that were outside of the QC limits.

_____

10. Were laboratory blanks analyzed at a minimum frequency of 1 per 20 samples? YES NO

a. If no, at what frequency were blanks performed.

_____

11. Was blank contamination, if any, <CRDL for all analytes? YES NO

a. If no, specify contaminant(s) and at what level(s) it was (they were) present.

_____

12. Were Matrix Spike analyses performed at a minimum frequency of 1 per SDG? YES NO

a. If no, why not? _____

13. Did the Matrix Spike meet the QC requirement of 75% - 125% R for all spike compounds? YES NO

a. If no, specify analyte(s) and %R(s) that were outside of the QC limits.

_____

14. Were Laboratory Duplicate analyses performed at a minimum frequency of 1 per SDG? YES NO

a. If no, why not? _____

15. Did the Laboratory Duplicate meet the QC requirement of <±20% RPD for all spike compounds? YES NO

a. If no, specify analyte(s) and RPD(s) that were outside of the QC limits.

_____

16. Were Laboratory Control Samples analyzed at a minimum frequency of 1 per SDG? YES NO

a. If no, why not? _____

17. Did the Laboratory Control Samples meet the QC requirement of 80% - 120% R for all spike compounds? YES NO

a. If no, specify analyte(s) and %R(s) that were outside of the QC limits.

_____

18. Were the CRDLs met for all analytes? YES NO

a. If no, why not? _____

19. Was it possible to analyze all analytes within the calibration range? YES NO

b. If no, why not? _____

SPECIAL ANALYTICAL SERVICES

Client Request

_____ Regional Transmittal _____ Telephone Request

A. EPA Region/Client: Region 9

B. Region Contact: RSCC Coordinator, [redacted]

C. Date of Request:

D. Site Name: Guyaux Landfill

E. City/State/ZIP Code: Colton, CA 92324

F. 2 Digit Superfund Site Identifier:

G. CERCLIS #: CAD 983652033

Please provide below a description of your request for Special Analytical Services under the Contract Laboratory Program. In order to most efficiently obtain laboratory capability for your request, please address all applicable questions. Incomplete or erroneous information may result in a delay in the processing of your request. If you need to provide additional information not addressed by the questions, please attach additional sheets of paper.

1. General description of analytical service requested:

The analysis of low concentration water samples for routine analytical services (RAS) target compound list (TCL) volatile organic compounds (VOCs) following protocols outlined in the U.S. EPA Contract Laboratory Program (CLP) Statement of Work (SOW) for Organics Analysis (OLM02.1 or more recent version). A 25-mL purge volume is used for sample analysis to achieve low quantitation limits.

2. Definition and number of work units involved (specify whether whole samples or fraction; whether organics or inorganics; whether aqueous or soil and sediments; and whether low, medium or high concentration):

3. Purpose of analysis (specify whether Superfund [enforcement or remedial action], RCRA, NPDES, etc.):

Superfund, enforcement

4. Estimated date(s) of collection (provide a sampling schedule):

March 11 - 15, 1996

5. Estimated date(s) and method of shipment:

Overnight carrier - samples are to be shipped on the day of collection for next day delivery.

6. Number of days analysis and data required after laboratory receipt of samples:

   a. The contract required analysis holding time is ten (10) days from the date of sample receipt by the laboratory.

   b. The technical analysis holding time is fourteen (14) days from the date of sample collection for preserved samples and seven (7) days from the date of sample collection for unpreserved samples.

   c. Data packages and all other deliverables are required within 35 days from receipt of last sample in each Sample Delivery Group (SDG). A SDG is defined as all samples received within a 14 day period or 20 samples, whichever is reached first.

7. Analytical protocol required (attach copy if other than a protocol currently used in this program):

   a. Follow the procedures outlined in Exhibit D of the CLP SOW (OLM02.1 or more recent version) for the analysis of VOCs in water by gas chromatography/mass spectrometry (GC/MS) with sample introduction by purge-and-trap instrumentation.

   b. A list of the VOC target compounds with corresponding contract required quantitation limits (CRQL) is provided in Table 1 of this special analytical services (SAS) client request form (CRF).

   c. Analyze a 25-mL sample aliquot for all samples which do not exceed the calibration range when run without dilution.

8. Special technical instructions (if outside protocol requirements, specify compound names, CAS numbers, detection limits, etc.):

a. Calibration Procedure and Criteria:

1. Perform a GC/MS tuning according to the procedure outlined in Exhibit D, Section 9.2 of the CLP SOW (OLM02.1 or more recent version). A GC/MS instrument performance check with 4-bromofluorobenzene (BFB) is required at the beginning of each 12 hour period during which standards and samples are analyzed. Instrument performance checks must meet the ion abundance criteria specified in Table 1 of Exhibit D, Section 17, of the CLP SOW (OLM02.1). The MS tune criteria must be met before any instrument calibration standards, environmental samples, laboratory method blanks, or quality control (QC) samples are analyzed.

2. Perform initial instrument calibration according to the procedure outlined in Exhibit D, Section III, Part C, Item 14 of the Superfund Analytical Methods for Low Concentration Water for Organics Analysis (SAMLCO, 10/92 or more recent version). Prepare initial calibration standards, containing all of the target analytes listed in Table 1 of this SAS CRF and system monitoring compounds, according the requirements of Table D-1 of Exhibit D, Section II, Part B, Item 7.5 of the SAMLCO (10/92) to the following specifications:

Volume of Working Standard (µL added to 25 mL)	Final Concentration of Aqueous Standard for Non-Ketones (µg/L)	Final Concentration of Aqueous Standard for Ketones (µg/L)
5	1	5
10	2	10
25	5	25
50	10	50
125	20 or 25	125

The minimum relative response factors (RRFs) for all analytes in the initial calibration must meet the acceptance criteria specified in Table D-3 of Exhibit D, Section V of the SAMLCO (10/92). The percent relative standard deviation

(%RSD) of analyte RRFs across the initial calibration curve must not exceed 30%.

3. Analyze a sixth initial calibration standard containing carbon tetrachloride, 1,2-dichloroethane, *cis*-1,3-dichloropropene, *trans*-1,3-dichloropropene, and vinyl chloride at a concentration of 0.5 µg/L to verify that the requested CRQLs can be achieved. The minimum RRF requirement for these analytes is 0.05. This low level standard need not be included with the other five initial calibration standards in calculating the %RSD for the standard curve.

4. Perform continuing instrument calibration according to the procedure outlined in Exhibit D, Section III, Part C, Item 15 of the SAMLCO (10/92) once per each 12 hour period of instrument operation. Prepare a continuing calibration standard, containing all of the target analytes listed in Table 1 of this SAS CRF, at concentrations equivalent to the midpoint of the initial calibration curve. The minimum RRFs for all analytes in the continuing calibration must meet the acceptance criteria specified in Table D-3 of Exhibit D, Section V of the SAMLCO (10/92). The percent difference (%D) between the RRFs from the continuing calibration and average RRFs from the initial calibration must not exceed ±30%.

5. When calibration standard measurements exceed the QC requirements for the initial calibration or the continuing calibration, take corrective action as specified in Exhibit D, Section III, Part C, Items 14.6 (for initial calibration) and 15.6 (for continuing calibration).

   The continuing calibration standard reflects the conditions under which the analysis of all associated samples was performed. Reanalyze all samples associated with an out-of-control continuing calibration standard.

b. **Internal Quality Control Checks, Control Limits and Corrective Actions:**

1. Analyze a laboratory method blank in each 12-hour time period in which samples are analyzed according to the procedure described in Exhibit D, Section 12.1 of the CLP SOW (OLM02.1 or more recent version). The concentration of target compounds in the laboratory method blanks must be less than the CRQL.

   If a method blank exceeds these acceptance criteria, the analytical system should be considered to be out-of-control.

Follow the corrective action procedures outlined in Exhibit D, Section 12.1.5 of the CLP SOW (OLM02.1). Investigate the source of the contamination and take and document appropriate corrective measures before proceeding with further sample analysis. Reanalyze all samples processed with a method blank that is out-of-control. Reanalyses must be performed at no additional cost to the Agency.

2. Spike all environmental samples, laboratory method blanks, and QC samples with the system monitoring compounds, toluene-d_8, 4-bromofluorobenzene (BFB), and 1,2-dichloroethane-d_4, according to the procedure outlined in Exhibit D, Section 10.1.3.7 of the CLP SOW (OLM02.1 or more recent version). Prepare the system monitoring compound spiking solution according to Exhibit D, Section 7.2.4.1 of the CLP SOW (OLM02.1).

   System monitoring compound recoveries within the limits for water specified in Table 7 of Exhibit D, Section 17 are required. If these control limits are exceeded, take appropriate action to identify the problem by reanalyzing the affected sample. If reanalysis solves the problem, then the problem was within the laboratory's control. In this case, submit only data from the analysis with system monitoring compound recoveries within QC limits. If reanalysis of the sample does *not* solve the problem, then submit data from both the initial analysis and the reanalysis.

3. Add the internal standard compounds bromochloromethane, chlorobenzene-d_5, and 1,4-difluorobenzene to all calibration standards, method blanks, and QC samples prior to analysis according to the procedure outlined in Exhibit D, Sections 9.3.3.3 (for initial calibration standards), 9.4.3.2 (for continuing calibration standards), and 10.1.3.7 (for samples and blanks) of the CLP SOW (OLM02.1 or more recent version). Prepare the internal standard compound spiking solution according to Exhibit D, Section 7.2.4.3 of the CLP SOW (OLM02.1).

   Internal standard area counts must not vary by more than a factor of 2 (-50% to +100%) from the area counts of the associated continuing calibration standard. Internal standard retention times (RT) must not vary by more than ±30 seconds from the (RT) of the associated continuing calibration standard. Refer to Exhibit D, Sections 11.3.5 and 11.3.6 of the CLP SOW (OLM02.1) for internal standard acceptance criteria. If these control limits are exceeded, reanalyze the affected sample. If reanalysis solves the problem, then the problem was within the laboratory's control. In this case, submit only data from the analysis

with internal standard areas within QC limits. If reanalysis of the sample does *not* solve the problem, then submit data from both the initial analysis and the reanalysis.

4. Analyze matrix spike and matrix spike duplicate (MS/MSD) samples at the frequency of one per sample delivery group according to the procedure outlined in Exhibit D, Section 12.2 of the CLP SOW (OLM02.1 or more recent version). Prepare the matrix spiking solution according to Exhibit D, Section 7.2.4.2 of the CLP SOW (OLM02.1); prepare MS/MSD samples according to the procedure outlined in Exhibit D, Section 12.2.3.1 of the CLP SOW (OLM02.1).

   MS/MSD recoveries, and relative percent differences (RPDs) between MS/MSD recoveries, within the limits specified for water in Table 8 of Exhibit D, Section 17 are required. Flag MS/MSD results that exceed these criteria and note noncompliant MS/MSD results in the SDG narrative. No corrective action measures are required due to noncompliant MS/MSD results.

5. Dilute and reanalyze samples which contain one or more target analytes at concentrations above the initial calibration range. If dilution is necessary, adjust the dilution so that the most highly concentrated analyte is determined at a concentration in the upper half of the calibration range. Report the results and submit documentation for both the diluted and undiluted analyses.

6. The QC requirements listed above are the minimum required. It is impossible to address all analytical situations that might be experienced by a laboratory during the analysis of environmental samples. The laboratory is expected to adhere to good laboratory practices when analyzing samples. If the laboratory has questions concerning the analyses of samples not addressed in this document, the Region should be notified IMMEDIATELY (through the Sample Management Office).

9. **Analytical results required (if known, specify format for data sheets, QA/QC reports, Chain-of-Custody documentation, etc.) If not completed, format of results will be left to program discretion.**

   a. **Data Calculations and Reporting Units:**

      1. Calculate the relative response factor (RRF) and the concentration of individual analytes according to the equations specified in Exhibit D, Sections 9.3.4.1 and 11.2.1 of the CLP SOW (OLM02.1 or more recent version).

Report sample results in concentration units of micrograms per liter (µg/L).

2. Ensure that all records of analysis, dilutions and calculations are legible and sufficient to recalculate all sample concentrations and QC results. Include an example of an *actual* sample calculation in the data package.

b. Documentation and Deliverables:

All documentation and deliverables as required in Exhibit B of the CLP SOW (OLM02.1 or more recent version) must be submitted. The required deliverables for each sample delivery group include, but are not limited to, the following:

1. All Sample Tracking Reports (i.e., signed SAS Packing Lists/Chain-of-Custody forms).

2. Complete SDG File (CSF) inventory on a modified CLP Form DC-2.

3. Sample log-in information on a modified CLP Form DC-1.

4. A copy of the SAS CRF, as provided by SMO (so that any revisions or additions authorized by SMO will be known). Only the technical portion of the SAS CRF is required.

5. Any telephone logs referring to the samples.

6. An SDG Narrative which includes: a signature of the laboratory manager (or his or her designee), laboratory name, EPA laboratory I.D., contract number, SAS number, SDG number, a description of any problems encountered during the processing of the samples, a description of the resolution of these problems, a list of correct EPA sample I.D. numbers, the corresponding laboratory sample I.D. numbers, a differentiation between the initial analyses and any reanalyses, the pH of all water samples, a formula (including definitions) showing how the results were calculated, and an example of an *actual* calculation for a sample in the SDG.

7. Modified CLP Form 1A for all environmental and QC samples which lists the tabulated sample results for all target analytes. The header of the Form 1A should include: sample matrix, analyte concentration units, sample volume, purge volume, dilution factor, and dates of sample receipt and analysis. Form 1s for any reanalyses or diluted analyses must be included.

8. Modified CLP Form 1E for all environmental samples which lists tentatively identified compounds. The header information should be the same as that provided in Form 1A.

9. Modified CLP Form 2A which lists the percent recovery (%R) values of the system monitoring compounds for all samples and laboratory method blanks.

10. Modified CLP Form 3A, a matrix spike/matrix spike duplicate (MS/MSD) results summary, which reports the percent recovery (%R) and relative percent difference (RPD) values for the spiked compounds.

11. Modified CLP Form 4A which summarizes the samples that were analyzed with each laboratory method blank.

12. CLP Form 5A which summarizes the data for BFB instrument performance checks.

13. Modified CLP Form 8A which summarizes areas and retention times of the internal standards for all samples, blanks, QC samples, and continuing calibration standards.

14. Raw sample data which include the following items:

    a. Reconstructed ion chromatogram (RIC) and mass spectra
    b. GC/MS quantitation report/data system printout
    c. Manual work sheet

15. Instrument calibration data which include the following items:

    a. Initial Calibration

        (1) Modified CLP Form 6A which includes: relative response factors (RRFs) for each analyte for each concentration level and percent relative standard deviations (%RSD) for each analyte.

        (2) Header of the modified CLP Form 6A must include: date and time of calibration, instrument I.D., and gas chromatographic (GC) analytical column I.D. (i.e. liquid phase, length, diameter).

        (3) Raw data which include: RICs and quantitation reports/data system printouts. Peak areas, concentrations, and RTs must be clearly indicated.

    b. Continuing Calibration

(1) Modified CLP Form 7A which includes: average relative response factors (RRFs) (from the initial calibration), RRFs (for the continuing calibration standard), and percent difference (%D) values for each analyte.

(2) Header of the modified CLP Form 7A must include: date and time of calibration, instrument I.D., and GC analytical column I.D.

(3) Raw data which include: RICs and quantitation reports/data system printouts. Peak areas, concentrations, and RTs must be clearly indicated.

16. Raw QC data which include the following items:

a. Blank data, in chronological order:

1. Tabulated results on a modified CLP Form 1A
2. RIC
3. GC/MS quantitation report/data system printout
4. Manual work sheet

b. MS/MSD data, in chronological order:

1. Tabulated results on a modified CLP Form 1A
2. RIC
3. GC/MS quantitation report/data system printout
4. Manual work sheet

17. Bench sheets for pH determination and dilutions. Bench sheets for sample preparation which include spike solution and system monitoring compound solution description (i.e. concentrations and volume added.)

18. Standards preparation logs, for all standards used for either calibration or spiking, which include source, traceable lot number, and concentrations of all compounds.

10. **Other (use additional sheets or attach supplementary information, as needed):**

Attached is a copy of the "U. S. EPA Region 9 Laboratory QC Summary Report" form. This form is to be completed by the Laboratory Manager or his/her designee and submitted with each data package. The form is to reflect the conditions contained within the data package with which it is submitted. Laboratories may make additional copies of this form as needed.

11. Name of sampling/shipping contact:

Phone: ( )

12. Data Requirements:

Parameter	Contract Required Quantitation Limit (CRQL)
Volatile organic compounds	refer to Table 1

13. QC Requirements:

QC Required	Frequency of QC	Limits (% or Conc.)
Laboratory method blanks	as per CLP SOW	<CRQL
MS/MSD	1 per SDG	as per CLP SOW

14. Action required if limits are exceeded:

If system monitoring compound control limits are exceeded, take appropriate actions to identify the problem by reanalyzing the affected samples. If a matrix problem is not indicated, corrective action should be taken before additional samples are analyzed.

TABLE 1
TARGET COMPOUND LIST

Analyte	CAS Number	Contract Required Quantitation Limit (CRQL) µg/L
Chloromethane	74-87-3	1
Bromomethane	74-83-9	1

U. S. EPA REGION 9
LABORATORY QC SUMMARY REPORT
INSTRUCTIONS

1. A separate form is to be completed and attached to the Regional copy (original) of each data package submitted. This form is to be placed directly behind the case narrative.

2. The Laboratory Quality Control Summary Report form is to be completed by the Laboratory Manager, or his/her designee.

3. This form will be used to identify areas of noncompliance with the required QC limits that may result in resampling or reduction in payment.

4. Answers to questions are designed so that a YES answer indicates compliance and requires no further explanation. A NO answer indicates non-compliance and requires a short explanation. If a lengthy explanation is required (or desired), write <u>See Case Narrative</u> in the blank space and include the explanation in the case narrative.

DATE: _____

QC SUMMARY TABLE

QC PARAMETER	QC LIMITS	FREQUENCY
Laboratory method blank (concentration of target analytes)	<CRQL	each 12 hour period during sample analysis
Initial and continuing calibration (4-bromofluorobenzene tuning)	as per requirements listed in Table 1 of Exhibit D, Section 17 of CLP SOW (OLM02.1)	beginning of each 12 hour period during sample analysis
Initial calibration (%RSD)	<30% for all analytes (in 5 point calibration)	as needed
Initial calibration (minimum relative response factor [RRF])	as per requirements listed in Table D-3 of Exhibit D, Section V of SAMLCO (10/92)	as needed
Initial calibration (minimum relative response factor [RRF])	≥ 0.05 (criterion applies to sixth initial calibration standard containing analytes with 0.5 µg/L CRQLs)	with every initial calibration performed
Continuing calibration (%D)	±30% for all analytes	every 12 hours during sample analysis

QC SUMMARY TABLE (Continued)

QC PARAMETER	QC LIMITS	FREQUENCY
Continuing calibration (minimum RRF)	as per requirements listed in Table D-3 of Exhibit D, Section V of SAMLCO (10/92)	every 12 hours during sample analysis
System monitoring compounds (%R)	as per requirements listed in Table 7 of Exhibit D, Section 17 of SOW (OLM02.1)	all standards, blanks, environmental samples, and QC samples
Internal standards (areas, retention times)	as per requirements listed in Exhibit D, Sections 11.3.5 and 11.3.6 of SOW (OLM02.1)	all blanks, environmental samples, and QC samples
MS/MSD (%R)	as per requirements listed in Table 8 of Exhibit D, Section 17 of SOW (OLM02.1)	1 per SDG
MS/MSD (RPD)	as per requirements listed in Table 8 of Exhibit D, Section 17 of SOW (OLM02.1)	1 per SDG

1. Were all samples analyzed within the contract required holding time of 10 days from the date of sample receipt? YES NO

   a. If no, list the samples that were analyzed outside of the holding time.

   _____

   b. How many days outside of the holding time were these samples analyzed?

   _____

2. Were all samples analyzed within the technical holding time of 14 days (for preserved samples) or 7 days (for unpreserved samples) from the date of collection? YES NO

a. If no, list the samples that were analyzed outside of the holding time..

_____

b. How many days outside of the holding time were these samples analyzed?

_____

3. Were all samples received intact and in good condition? YES NO

4. Was the data package sent within 35 days from the receipt of the last samples in the SDG? YES NO

a. If no, how many days late was the data package sent?

_____

5. Were the protocols outlined in the Contract Laboratory Program (CLP) Statement of Work (SOW) for Organics Analysis (OLM02.1 or more recent version) followed for the analysis of these samples? YES NO

a. If no, specify which method was used.

_____

b. If no, why was this method used and who authorized its use?

_____

c. Was the approved method followed without modifications or deviations? YES NO

d. If no, specify what the modification or deviations were and who approved them.

_____

6. Was a BFB tune performed every 12 hours during sample analysis? YES NO

a. If no, why not? _____

7. Were the ion abundance criteria specified in Table 1 of Exhibit D, Section 17 of the SOW (OLM02.1) met for all BFB tunes that were performed? YES NO

a. If no, why not? _____

8. Was a 5-point initial calibration curve analyzed prior to sample analyses? YES NO

a. If yes, when? _____

b. If no, why not? _____

9. Did the initial calibration standards contain all target analytes at the concentrations specified in Table D-1 of Exhibit D, Section II, Part B, Item 7.5 of the Superfund Analytical Methods for Low Concentration Water for Organics Analysis (SAMLCO, 10/92)? YES NO

a. If no, why not? _____

10. Did the initial calibration curve meet the QC requirement of <30% RSD for all target compounds? YES NO

a. If no, specify the analyte(s) and %RSD(s) that were outside of the QC limits.

_____

_____

_____

11. Was a sixth initial calibration standard containing carbon tetrachloride, 1,2-dichloroethane, *cis* and *trans*-1,3-dichloropropene, and vinyl chloride at a concentration of 0.5 µg/L analyzed as part of the initial calibration? YES NO

a. If no, why not? _____

12. Was a minimum RRF of 0.05 achieved for all analytes in the sixth initial calibration standard? YES NO

a. If no, why not? _____

13. Was a continuing calibration standard analyzed every 12-hour time period in which samples were analyzed? YES NO

a. If no, why not? _____

14. Were percent differences (%D) for target compounds in the continuing calibration standards within the QC requirement of ±30%? YES NO

a. If no, specify the analyte(s) and %D(s) that were outside of the QC limits.

_____

_____

_____

15. Were the RRFs for analytes in the initial calibration within the requirements specified Table D-3 of Exhibit D, Section V of the SAMLCO (10/92)? YES NO

In continuing calibrations? YES NO

a. If no, why not? _____

16. Was a 25-mL purge volume used for the analysis of all samples? YES NO

a. If no, why not? _____

17. Were the area counts of all internal standards within -50% to +100% of the area count for each respective internal standard in the associated continuing calibration? YES NO

a. If no, specify the sample(s) and internal standard(s) that were outside of the QC limits.

_____

18. Were the retention times of all the internal standards within ±30 seconds of the retention time for each respective internal standard in the associated continuing calibration? YES NO

a. If no, specify the sample(s) and internal standard(s) that were outside of the QC limits.

_____

19. Were laboratory method blanks analyzed at a minimum frequency of 1 per each 12 hour period during sample analysis? YES NO

a. If no, at what frequency were method blank analyses performed.

_____

20. Were laboratory method blanks free of contamination at concentrations greater than the CRQL for all analytes? YES NO

a. If no, specify contaminant(s) and at what level(s) it was (they were) present.

_____

_____

21. Were recoveries for system monitoring compounds within the requirements specified in Table 7 of Exhibit D, Section 17 of the CLP SOW (OLM02.1) for all samples? YES NO

a. If no, list the recoveries and the associated samples that were above this range.

_____

b. If no, list the recoveries and the associated samples that were below this range.

_____

c. How many noncompliant recoveries were caused by dilutions?

_____

d. How many noncompliant recoveries were caused by matrix interferences?

_____

e. Were samples with noncompliant recoveries reanalyzed? YES NO

If no, why not? _____

22. Were MS/MSD analyses performed at a minimum frequency of 1 per SDG? YES NO

a. If no, why not? _____

23. Were MS/MSD recoveries within the requirements specified in Table 8 of Exhibit D, Section 17, of the CLP SOW (OLM02.1) for all spike compounds? YES NO

a. If no, specify the analyte(s) and %R(s) that were outside of the QC limits.

_____

24. Were the relative percent differences (RPDs) between MS/MSD recoveries within the requirements specified in Table 8 of Exhibit D, Section 17 of the SOW (OLM02.1) for all spike compounds? YES NO

a. If no, specify the analyte(s) and %RPD(s) that were outside of the QC limits.

_____

25. Were the CRQLs met for all analytes? YES NO

a. If no, why not? _____

26. Was it possible to analyze all target compounds within the range of the initial calibration curve? YES NO

a. If no, were these samples diluted according to the instructions in Section 8.b.5 of the SAS Client Request Form? YES NO

b. List these samples, the analytes above range, and the analyte concentration.

_____

_____

c. If no, explain why not and list the samples.

_____

_____

Laboratory: Region IX
Reviewer: Dawn Richmond, QAMS, P-3-2/USEPA
Date: May 09, 1996

I. Case Summary

SAMPLE INFORMATION:

VOA Sample Numbers:	SYJ205, SYJ206, SYJ207, SYJ208, SYJ209, SYJ210, SYJ211, SYJ212, and SYJ214
Concentration and Matrix:	Low Level Water
Analysis:	RAP Volatiles
SOW:	3/90 (July 1993 revision)
Collection Date:	March 11 through March 13, 1996
Sample Receipt Date:	March 14 through March 15, 1996
Extraction Date:	N/A
Analysis Date:	March 22, 1996 and March 25, 1996

FIELD QC:

Trip Blanks (TB):	None
Field Blanks (FB):	None
Equipment Blanks (EB):	SYJ210, SYJ211, SYJ212, and SYJ214
Background Samples (BG):	SYJ205
Field Duplicates (D1):	SYJ207 and SYJ208

METHOD BLANKS AND ASSOCIATED SAMPLES:

VBLK004:	SYJ206, SYJ207, and SYJ208
VBLK006:	SYJ205, SYJ209, SYJ210, SYJ211, SYJ212, SYJ214, SYJ206MS, and SYJ206MSD
VBLK010:	VHBLK1

TABLES:

1A:	Analytical Results with Qualifications
1B:	Data Qualifiers

TPO ACTION:

SAMPLING ISSUES: None.

OTHER: None.

TPO ATTENTION:

SAMPLING ISSUES: Acetone, 1,1,2-Trichloroethane, and 1,2-Dichlorobenzene, were present in at least one of the equipment blanks, however the samples were all non-detect for these compounds, with the exception of the performance evaluation (PE) sample. The PE sample was greater than the ten times/five times contamination rule. If the concentration of the compound in the sample exceeds 10 times the amount in any associated blank for the common laboratory contaminants or five times the amount in any associated blank for other contaminants, no qualification is applied.

OTHER: None.

ADDITIONAL COMMENTS:

The analytical results with qualifications are listed in Table 1A. This report was prepared in accordance with EPA document "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", February 1994. **A performance evaluation sample was analyzed and the results were within the specified limits.**

SYSTEM PERFORMANCE	[YES]	[ ]

III. Introduction

Nine (09) low water samples from the Guyaux Landfill were submitted to the EPA Region IX laboratory for RAP volatile organic analyses during the period of March 14 through March 15, 1996.

IV. Validity and Comments

A) Due to low Relative Response Factors (RRFs) in the Initial and Continuing Calibrations, the quantitation limits for the following analytes are estimated (J,U) (see Table 1A):

- 1,2-dibromo-3-chloropropane in all samples, spikes, and method blanks.

The RRF evaluates instrument sensitivity and is used in the quantitation of the target analytes.

Average RRFs below 0.05 were observed for 1,2-Dibromo-3-chloropropane in the Initial Calibrations (ICALs) and Continuing Calibrations (CCALs) performed for all SDG analysis dates. These values are below the 0.05 QC advisory validation criterion specified in the Functional Guidelines. Since the results for these analytes are nondetected, false negatives may exist.

B) 2-Butanone in sample SYJ209 was missing some of the major ions in the mass spectra. Therefore this compound was qualified as non-detect (U) at the CRQL in this sample. Additionally, the tentatively identified compound, 3-Methoxy-3-Methyl-2-Butanone in sample SYJ207 was also missing some of the major ions in the mass spectra. Therefore it was changed to "unknown" on the form 1E.

C) Several tentatively identified compounds were reported in samples and blanks as various "siloxanes". It should be noted that these compounds are common as "column bleed" and most likely came from the instrument and not the samples.

D) The following results are estimated and flagged "J" in Table 1A:

- All results below the Contract Required Quantitation Limits (denoted with an "L" qualifier)

Results below the Contract Required Quantitation Limits (CRQL) are considered to be qualitatively acceptable, but quantitatively unreliable, due to the uncertainty in analytical precision near the limit of detection.

E) All other results are considered valid for all purposes.

TABLE 1B
DATA QUALIFIERS

The definitions of the following qualifiers are prepared according to the EPA draft document, "National Functional Guidelines for Organic Data Review," February 1994.

NO QUALIFIERS indicate that the data are acceptable both qualitatively and quantitatively.

U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

L Indicates results which fall below the Contract Required Quantitation Limit. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

MEMORANDUM

SUBJECT: Reporting of Tentatively Identified Compounds from GC/MS Analyses in the Region IX Data Validation Report

FROM: Rich Bauer, Environmental Scientist
Quality Assurance Management Section (P-3-2)

TO: Region IX Data Users

If you are a frequent user of validated GC/MS data from the EPA Contract Laboratory Program (CLP) in Region IX, you will notice some differences in the reporting format for the Tentatively Identified Compounds (TICs) reported for your samples.

In the past, Region IX data reviewers have transcribed the TIC results reported by the laboratory onto a table (Table 1C), and have assigned rankings (A, B, or C) for the probability that compound identification is correct. The transcription is very time consuming and labor intensive, and the ranking very subjective. The reviewers will now simply include annotated copies of the TIC reporting forms submitted by the laboratories into the data validation report. Reviewers will continue to evaluate the TICs for spurious or mis-identified data, and will annotate the forms accordingly.

We believe that the old method of reporting TICs resulted in a large expense in time and money without contributing much "value added" to the report.

I would welcome any comments or questions you might have on our new reporting format. Please feel free to call me at (415) 744-1499.

III. Validity and Comments

A. All results near the detection limit are qualified with a "J" to indicate that the results should be considered estimated. The rationale for this is that the results should be considered qualitatively acceptable but quantitatively unreliable due to high uncertainty in the analytical precision near the limit of detection.

B. The relative percent difference (RPD) between the field duplicate sample results is 20.7%.

LOCKHEED MARTIN

Data Validation Report

Case No.: 24477 Memo #03
Site: Guyaux Landfill
Laboratory: TMA/Skinner & Sherman Labs, Inc. (SKINER)
Reviewer: Margie D. Weiner, ESAT/Lockheed
Date: May 17, 1996

I. Case Summary

SAMPLE INFORMATION: SAMPLE #: MYW331 through MYW338

COLLECTION DATE: March 12 and 13, 1996
SAMPLE RECEIPT DATE: March 18, 1996

CONCENTRATION & MATRIX: 8 Low concentration soil samples

FIELD QC: Field Blanks (FB): None
Equipment Blanks (EB): MYW307, MYW308 and MYW310 (see Additional Comments)
Background Samples (BG): None
Duplicates (D1): MYW319 and MYW336 (see Additional Comments)
(D2): MYW327 and MYW337 (see Additional Comments)
(D3): MYW331 and MYW338

LABORATORY QC: Matrix Spike: MYW333
Duplicates: MYW333
ICP Serial Dilution: MYW333

ANALYSIS: Total Metals

Analyte	Sample Preparation and Digestion Date	Analysis Date
ICP Metals	March 25, 1996	March 29 and April 4, 1996
Mercury	March 21, 1996	March 22, 1996
Percent Solids	Not Applicable	March 25, 1996

TPO ACTION:

The results reported for selenium in all of the samples are considered unacceptable as less than 30% of the matrix spike was recovered. See Comment A.

TPO ATTENTION:

Selenium and thallium in samples MYW332, MYW333 and MYW337 were diluted by a factor of five because the ICP linear range for manganese was exceeded. Based on the manganese concentrations found in the samples and on guidance provided in Section I, Exhibit D-1 of the Inorganic SOW, a dilution factor of two would have been more appropriate. See Comment G.

SAMPLING ISSUES:

The results for mercury in samples MYW331, MYW333, MYW334 and MYW338 are qualified as nondetected because of equipment blank contamination. The reported result of 0.48 µg/L (0.24 mg/Kg) for mercury in equipment blank sample MYW308 (collected on 3/13/96) exceeds the contract required detection limit (CRDL) of 0.20 µg/L for mercury.

ADDITIONAL COMMENTS:

The results for equipment blank samples MYW307, MYW308 and MYW310 are included in Case 24477 Memo #05, sample delivery group (SDG) MYW301.

The results for sample MYW319, the field duplicate of sample MYW336, and for sample MYW327, the field duplicate of sample MYW337, are included in Case 24477 Memo 04, SDG MYW311.

The laboratory analyzed all of the samples for arsenic, lead, selenium and thallium by Thermo Jarrell Ash ICAP61E Trace Analyzer according to Method 200.7 in the CLP Inorganic Statement of Work (SOW). The method detection limits (MDLs) for arsenic, lead, selenium, and thallium were below the contract required detection limits (CRDL) specified for these analytes in the Inorganic SOW.

The analytical results with qualifications are listed in Table 1A. The definitions of the data qualifiers used in Table 1A are listed in Table 1B. This report was prepared in accordance with the EPA Contract Laboratory Program Inorganic Statement of Work (ILMO4.0), and the document "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review," February, 1994.

II. Validation Summary

The data were evaluated based on the following parameters:

Parameter	Acceptable	Comment
1. Data Completeness	Yes	
2. Sample Preservation and Holding Times	Yes	
3. Calibration	Yes	
a. Initial Calibration Verification		
b. Continuing Calibration Verification		
c. Calibration Blank		
d. CRDL Standard		
4. Blanks	No	E
a. Laboratory Preparation Blank		
b. Field Blank		
c. Equipment Blank		
5. ICP Interference Check Sample Analysis	Yes	
6. Laboratory Control Sample Analysis	Yes	
7. Spiked Sample Analysis	No	A,B
8. Laboratory Duplicate Sample Analysis	No	D
9. Field Duplicate Sample Analysis	No	F
10. GFAA QC Analysis	N/A	
a. Duplicate Injections		
b. Analytical Spikes		
c. Method of Standard Addition		
11. ICP Serial Dilution Analysis	Yes	
12. Sample Quantitation	Yes	C,G
13. Sample Result Verification	Yes	

N/A = Not Applicable

III. Validity and Comments

A. The following results are rejected because of matrix spike recovery results outside method quality control (QC) limits. The results are flagged "R" in Table 1A.

- Selenium in all of the samples

The matrix spike recovery result for selenium in QC sample MYW333 did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for selenium are presented below and are based on an ideal recovery of 100%.

Analyte	MYW333 % Recovery	MYW333 % Bias
Selenium	0	-100

The results reported for selenium in all of the samples were below the method detection limit (MDL) and are considered unacceptable as less than 30% of the matrix spike was recovered. The low matrix spike recovery indicates an analytical deficiency and false negatives may exist. Due to the ICP linear range for manganese being exceeded in several samples, QC sample MYW333 was diluted by a factor of 5. As a result, the amount of spike added for selenium was diluted out in the sample. Please refer to Comment G for additional information.

According to the Inorganic SOW, when the pre-digestion spike recovery results for ICP analytes (except silver) fall outside the control limits of 75-125%, a post-digestion spike must be performed for those elements that do not meet the specified criteria. A post-digestion spike recovery result of 0% was obtained for selenium in QC sample MYW333. Since both the post and pre-digestion spikes did not meet the QC criteria, matrix effects may be present in the sample digestate which may depress the analyte signal during analysis.

Matrix spike sample analysis provides information about the effect of the sample matrix on sample preparation and measurement methodology.

B. The following results are estimated because of matrix spike recovery results outside method QC limits. The results are flagged "J" in Table 1A.

- Antimony and nickel in all of the samples

The matrix spike recovery results for antimony and nickel in QC sample MYW333 did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for each analyte are presented below and are based on an ideal recovery of 100%.

Analyte	MYW333 % Recovery	MYW333 % Bias
Antimony	46	-54
Nickel	66	-34

Results above the MDL are considered quantitatively uncertain. The results reported for antimony and nickel in all of the samples may be biased low, and where non-detected, false negatives may exist.

Post-digestion spike recovery results of 79% and 118% were obtained for antimony and nickel, respectively, in QC sample MYW333. Since the post-digestion spike recovery results were acceptable, the low pre-digestion spike recovery results obtained for antimony and nickel may indicate sample nonhomogeneity, poor laboratory technique or matrix effects which may interfere with accurate analysis, depressing the analytical result.

C. The following results are estimated and are flagged "J" in Table 1A.

- All results above the method detection limit but below the contract required detection limit (denoted with an "L" qualifier)

Results above the method detection limit (MDL) but below the contract required detection limit (CRDL) are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

D. The following results are estimated because of laboratory duplicate results outside method QC limits. The results are flagged "J" in Table 1A.

- Chromium in all of the samples

Laboratory duplicate results did not meet the ±35 relative percent difference (RPD) and ±2X CRDL criteria for precision as listed below.

Analyte	MYW333 Lab. Dup. RPD
Chromium	37.8

The results reported for chromium in all of the samples are considered quantitatively uncertain.

Duplicate analyses demonstrate the analytical precision obtained for each sample matrix. The imprecision between duplicate results may be due to sample nonhomogeneity, poor laboratory technique, or method defects.

E. The following results are qualified because of equipment blank contamination. The results are flagged "U" in Table 1A.

- Mercury in samples MYW331, MYW333, MYW334 and MYW338

Sample results greater than the MDL are qualified as nondetected (U) unless the concentration of the analyte in the sample exceeds 5 times the amount in any associated blank for mercury.

The reported result of 0.48 µg/L (0.24 mg/Kg) for mercury in equipment blank sample MYW308 (collected on 3/13/96) exceeds the CRDL of 0.20 µg/L for mercury.

An equipment blank is reagent water that has been collected as a sample using decontaminated sampling equipment. The intent of an equipment blank is to monitor for contamination introduced by the sampling activity, although any laboratory introduced contamination will also be present.

F. RPDs of 40 and 58 were obtained for cadmium and zinc, respectively, in the analysis of field duplicate pair samples MYW331 and MYW338. The results are expected to vary more than laboratory duplicates (±35 RPD or ±2xCRDL criteria for precision) since sampling variability is included in the measurement. The effect on the quality of the data is not known.

The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results of the analysis of the field duplicate pair may be due to the sample

matrix, sample nonhomogeneity, poor sampling or laboratory technique, or method defects.

G. Due to an element exceeding the ICP linear range, the following samples were diluted and the quantitation limits for the analytes shown below have been raised in Table 1A.

- Selenium and thallium in samples MYW332, MYW333, and MYW337

The samples listed above were diluted by a factor of five because the ICP linear range for manganese was exceeded. Dilution of the samples was necessary to properly apply the ICP interelement correction factors. Consequently, the quantitation limits reported in Table 1A for selenium and thallium in the samples listed above were raised by the dilution factor.

Section I, Exhibit D-1 of the Inorganic SOW states that "The contractor shall use the least dilution necessary to bring the analyte(s) within the valid analytical range (but not below the CRDL) and report the highest valid value for each analyte measured from the undiluted and diluted analyses." Based on the manganese concentrations found in the samples, a dilution factor of two would have been more appropriate.

Note that the result for arsenic in the diluted analyses of sample MYW332 was between the MDL and CRDL. Therefore the result, which is greater than the CRDL when multiplied by the dilution factor, has been flagged "L" (see Comment C).

LOCKHEED MARTIN

TABLE 1B

DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW

The definitions of the following qualifiers are prepared in accordance with the document "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review," February, 1994.

U The analyte was analyzed for, but was not detected above the level of the reported value. The reported value is either the sample quantitation limit or the sample detection limit for all the analytes except Cyanide (CN) and Mercury (Hg). For CN and Hg, the reported value is the Contract Required Detection Limit (CRDL).

L Indicates results which fall between the sample detection limit and the CRDL. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

J The associated value is an estimated quantity. The analyte was analyzed for and was positively identified, but the reported numerical value may not be consistent with the amount actually present in the environmental sample.

R The data are unusable. The analyte was analyzed for, but the presence or absence of the analyte can not be verified.

UJ A combination of the "U" and the "J" qualifier. The analyte was analyzed for but was not detected. The reported value is an estimate and may be inaccurate or imprecise.

FB-Field Blank, EB-Equipment Blank, TB-Trip Blank, BG-Background Sample
CRDL-Contract Required Detection Limit

The results reported for nickel in all of the samples are considered quantitatively uncertain.

Duplicate analyses demonstrate the analytical precision obtained for each sample matrix. The imprecision between duplicate results may be due to sample nonhomogeneity, poor laboratory technique, or method defects.

D. The following results are qualified because of equipment blank contamination. The results are flagged "U" in Table 1A.

- Mercury in samples MYW311, MYW312, MYW317, MYW320, MYW322, MYW323, MYW324, MYW326, MYW329 and MYW330

Sample results greater than the MDL are qualified as nondetected (U) unless the concentration of the analyte in the sample exceeds 5 times the amount in any associated blank for mercury.

The reported result of 0.48 µg/L (0.24 mg/Kg) for mercury in equipment blank sample MYW308 (collected on 3/13/96) exceeds the CRDL of 0.20 µg/L for mercury.

An equipment blank is reagent water that has been collected as a sample using decontaminated sampling equipment. The intent of an equipment blank is to monitor for contamination introduced by the sampling activity, although any laboratory introduced contamination will also be present.

E. Due to an element exceeding the ICP linear range, the following samples were diluted and the quantitation limits for the analytes shown below have been raised in Table 1A.

- Selenium and thallium in samples MYW327, MYW328, and MYW329

The samples listed above were diluted by a factor of five because the ICP linear range for manganese was exceeded. Dilution of the samples was necessary to properly apply the ICP interelement correction factors. Consequently, the quantitation limits reported in Table 1A for selenium and thallium in the samples listed above were raised by the dilution factor.

Section I, Exhibit D-1 of the Inorganic SOW states that "The contractor shall use the least dilution necessary to bring the analyte(s) within the valid analytical range (but not below the CRDL) and report the highest valid value for each analyte measured from the undiluted and diluted analyses." Based on the manganese concentrations found in the samples, a dilution factor of two would have been more appropriate.

III. Validity and Comments

A. The following results are estimated and are flagged "J" in Table 1A.

- All results above the method detection limit but below the contract required detection limit (denoted with an "L" qualifier)

Results above the method detection limit (MDL) but below the contract required detection limit (CRDL) are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

B. The following results are estimated because of matrix spike recovery results outside method QC limits. The results are flagged "J" in Table 1A.

- Antimony and thallium in all of the samples

The matrix spike recovery results for antimony and thallium in QC sample MYW321 did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for each analyte are presented below and are based on an ideal recovery of 100%.

Analyte	MYW321 % Recovery	MYW321 % Bias
Antimony	60	-40
Thallium	69	-31

Results above the MDL are considered quantitatively uncertain. The results reported for antimony and thallium in all of the samples may be biased low, and where non-detected, false negatives may exist.

Post-digestion spike recovery results of 97% and 30% were obtained for antimony and thallium, respectively, in QC sample MYW321. Since the post-digestion spike recovery result for antimony was acceptable, the low pre-digestion spike recovery result obtained may indicate sample nonhomogeneity, poor laboratory technique or matrix effects which may interfere with accurate analysis, depressing the analytical result. Since both the post and pre-digestion spikes for thallium did not meet the QC criteria, matrix effects may be present in the sample digestate which may depress the analyte signal during analysis.

Matrix spike sample analysis provides information about the effect of the sample matrix on sample preparation and measurement methodology.

C. The following results are estimated because of laboratory duplicate results outside method QC limits. The results are flagged "J" in Table 1A.

- Nickel in all of the samples

Laboratory duplicate results did not meet the ±35 relative percent difference (RPD) and ±2X CRDL criteria for precision as listed below.

Analyte	MYW321 Lab. Dup. RPD
Nickel	41

ADDITIONAL COMMENTS:

The results for equipment blank samples MYW306, MYW307, MYW308 and MYW310 are included in Case 24477 Memo #05, sample delivery group (SDG) MYW301.

The results for sample MYW336, the field duplicate of sample MYW319, and for sample MYW337, the field duplicate of sample MYW327, are included in Case 24477 Memo #03, SDG MYW331.

The laboratory analyzed all of the samples for arsenic, lead, selenium and thallium using the Thermo Jarrell Ash ICAP61E Trace Analyzer according to Method 200.7 in the CLP Inorganic Statement of Work (SOW). The method detection limits (MDLs) for arsenic, lead, selenium, and thallium were below the CRDL specified for these analytes in the Inorganic SOW.

Chromium was found in the ICP interference check sample (ICS) solution A at concentrations of -4 µg/L and -6 µg/L. A true value of 21 µg/L is listed in Form 4 for chromium. Based on the low concentrations obtained for chromium in the ICP ICS solution A, the interelement correction factors and the true values of the interferents should be reevaluated.

The analytical results with qualifications are listed in Table 1A. The definitions of the data qualifiers used in Table 1A are listed in Table 1B. This report was prepared in accordance with the EPA Contract Laboratory Program Inorganic Statement of Work (ILMO4.0), and the document "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review," February, 1994.

II. Validation Summary

The data were evaluated based on the following parameters:

Parameter	Acceptable	Comment
1. Data Completeness	Yes	
2. Sample Preservation and Holding Times	Yes	
3. Calibration	Yes	
a. Initial Calibration Verification		
b. Continuing Calibration Verification		
c. Calibration Blank		
d. CRDL Standard

I. Case Summary

SAMPLE INFORMATION: SAMPLE #: MYW311 through MYW330

COLLECTION DATE: March 11 through 13, 1996
SAMPLE RECEIPT DATE: March 18, 1996

CONCENTRATION & MATRIX: 20 Low concentration soil samples

FIELD QC: Field Blanks (FB): None
Equipment Blanks (EB): MYW306, MYW307, MYW308 and MYW310 (see Additional Comments)
Background Samples (BG): MYW311 and MYW312
Duplicates (D1): MYW319 and MYW336 (see Additional Comments)
(D2): MYW327 and MYW337 (see Additional Comments)

LABORATORY QC: Matrix Spike: MYW321
Duplicates: MYW321
ICP Serial Dilution: MYW321

ANALYSIS: Total Metals

Analyte	Sample Preparation and Digestion Date	Analysis Date
ICP Metals	March 22, 1996	March 29 and April 8, 1996
Mercury	March 25, 1996	March 26, 1996
Percent Solids	Not Applicable	March 22, 1996

TPO ACTION:

None.

TPO ATTENTION:

Arsenic, lead, selenium and thallium in samples MYW327, MYW328 and MYW329 were diluted by a factor of five because the ICP linear range for manganese was exceeded. Based on the manganese concentrations found in the samples and on guidance provided in Section I, Exhibit D-1 of the Inorganic SOW, a dilution factor of two would have been more appropriate. See Comment E.

SAMPLING ISSUES:

The results for mercury in samples MYW311, MYW312, MYW317, MYW320, MYW322, MYW323, MYW324, MYW326, MYW329 and MYW330 are qualified as nondetected because of equipment blank contamination. The reported result of 0.48 µg/L (0.24 mg/Kg) for mercury in equipment blank sample MYW308 (collected on 3/13/96) exceeds the contract required detection limit (CRDL) of 0.20 µg/L for mercury.

AREAS OF CONCERN: High percent recoveries of 155% and 165% were obtained for mercury in the cold vapor analysis of the CRDL standard (CRI). While there are no criteria established for CRDL standard recoveries, high recoveries may indicate high bias for sample results near the CRDL. It should be noted that high recoveries may indicate high bias for the mercury results in samples MYW302 through MYW304.

LOCKHEED MARTIN

TABLE 1B

DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW

The definitions of the following qualifiers are prepared in accordance with the document "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review," February, 1994.

U The analyte was analyzed for, but was not detected above the level of the reported value. The reported value is either the sample quantitation limit or the sample detection limit for all the analytes except Cyanide (CN) and Mercury (Hg). For CN and Hg, the reported value is the Contract Required Detection Limit (CRDL).

L Indicates results which fall between the sample detection limit and the CRDL. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

J The associated value is an estimated quantity. The analyte was analyzed for and was positively identified, but the reported numerical value may not be consistent with the amount actually present in the environmental sample.

R The data are unusable. The analyte was analyzed for, but the presence or absence of the analyte can not be verified.

UJ A combination of the "U" and the "J" qualifier. The analyte was analyzed for but was not detected. The reported value is an estimate and may be inaccurate or imprecise.

FB-Field Blank, EB-Equipment Blank, TB-Trip Blank, BG-Background Sample
CRDL-Contract Required Detection Limit
PE- Performance Evaluation Sample

The matrix spike recovery results for mercury in QC sample MYW302 did not meet the 75-125% criteria for accuracy. The percent recovery and possible percent bias for mercury are presented below and are based on an ideal recovery of 100%.

Analyte	MYW302 % Recovery	MYW302 % Bias
Mercury	64	-36

Results above the IDL are considered quantitatively uncertain. The results reported for mercury in samples MYW301 through MYW305 may be biased low.

A matrix spike recovery result of 183% was obtained for selenium in QC sample MYW302. Since results of the associated matrix specific samples are nondetected, no qualification of data is necessary.

The matrix spike sample analysis provides information about the effect of the sample matrix on the digestion and measurement methodology.

C. The following results are qualified because of equipment blank contamination. The results are flagged "U" in Table 1A.

- Lead and mercury in samples MYW301 through MYW304

Sample results greater than the IDL are qualified as nondetected (U) unless the concentration of the analyte in the sample exceeds 5 times the amount in any associated blank for lead and mercury.

The reported results of 4.1 µg/L for lead in equipment blank sample MYW310 and 0.48 µg/L for mercury in equipment blank sample MYW308 exceed the CRDL of 3.0 µg/L for lead and 0.20 µg/L for mercury.

An equipment blank is reagent water that has been collected as a sample using decontaminated sampling equipment. The intent of an equipment blank is to monitor for contamination introduced by the sampling activity, although any laboratory introduced contamination will also be present.

D. High percent recoveries of 155% and 165% were obtained for mercury in the cold vapor analysis of the CRDL standard (CRA). While there are no criteria established for CRDL standard recoveries, high recoveries may indicate high bias for sample results near the CRDL. It should be noted that high recoveries may indicate high bias for the mercury results in samples MYW302 through MYW304.

according to Method 200.7 in the CLP Inorganic Statement of Work (SOW). The instrument detection limits (IDL) for arsenic, lead, selenium, and thallium were below the CRDL specified for these analytes in the Inorganic SOW.

The analytical results with qualifications are listed in Table 1A. The definitions of the data qualifiers used in Table 1A are listed in Table 1B. This report was prepared in accordance with the EPA Contract Laboratory Program Inorganic Statement of Work (ILM04.0), and the document "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review," February, 1994.

II. Validation Summary

The data were evaluated based on the following parameters:

c. Method of Standard Addition		
11. ICP Serial Dilution Analysis	Yes	
12. Sample Quantitation	Yes	A
13. Sample Result Verification	Yes	

N/A = Not Applicable

III. Validity and Comments

A. The following results are estimated and are flagged "J" in Table 1A.

- All results above the instrument detection limit but below the contract required detection limit (denoted with an "L" qualifier)

Results above the instrument detection limit (IDL) but below the contract required detection limit (CRDL) are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

B. The following results are estimated because of matrix spike recovery results outside method QC limits. The results are flagged "J" in Table 1A.

- Mercury in samples MYW301 through MYW304

I. Case Summary

SAMPLE INFORMATION: SAMPLE #: MYW301 through MYW308 and MYW310

COLLECTION DATE: March 11 through 13, 1996
SAMPLE RECEIPT DATE: March 18, 1996

CONCENTRATION & MATRIX: 9 Low concentration groundwater samples

FIELD QC: Field Blanks (FB): None
Equipment Blanks (EB): MYW306, MYW307, MYW308 and MYW310
Background Samples (BG): MYW301
Performance Evaluation (PE): MYW305
Duplicates (D1): MYW303 and MYW304

LABORATORY QC: Matrix Spike: MYW302
Duplicates: MYW302
ICP Serial Dilution: MYW302

ANALYSIS: Total Metals

Analyte	Sample Preparation and Digestion Date	Analysis Date
ICP Metals	March 19, 1996 and April 4, 1996	March 28, 1996 and April 4, 1996
Mercury	April 3 and 4, 1996	April 3 and 4, 1996

TPO ACTION:

None.

TPO ATTENTION:

None.

SAMPLING ISSUES:

The results for lead in samples MYW301 through MYW304 and mercury in samples MYW301 through MYW305 are qualified as nondetected because of equipment blank contamination. The reported results of 4.1 µg/L for lead in equipment blank sample MYW310 and 0.48 µg/L for mercury in equipment blank sample MYW308 exceed the contract required detection limit (CRDL) of 3.0 µg/L for lead and 0.20 µg/L for mercury.

ADDITIONAL COMMENTS:

The field QA/QC form specifies sample MYW305 as a performance evaluation (PE) sample. The true value concentrations were not provided for review and evaluation, therefore, overall laboratory performance could not be determined.

The laboratory analyzed all of the samples for arsenic, lead, selenium and thallium using the Thermo Jarrell Ash ICAP61E Trace Analyzer

MEMORANDUM

TO: Gordon Woodrow
Site Assessment Manager
Planning & Assessment Section, H-8-1

THROUGH: Rose Fong Rose
ESAT Regional Project Officer
Quality Assurance Management Section (QAMS), P-3-2

FROM: MWM for Jack Berges
Team Manager
Environmental Services Assistance Team (ESAT)

ESAT Contract No.: 68D60005
Work Assignment No.: 09-96-0-04
Technical Direction No.: 9604016

DATE: May 17, 1996

SUBJECT: Review of Analytical Data

Attached are comments resulting from ESAT Region 9 review of the following analytical data:

SITE:	Guyaux Landfill
SITE ACCOUNT NO.:	ZZ
CERCLIS I.D. NO.:	CAD983652033
CASE NO.:	24477 Memo #05
SDG NO.:	MYW301
LABORATORY:	TMA/Skinner & Sherman Labs, Inc. (SKINER)
ANALYSIS:	Total Metals
SAMPLE NO.:	9 Water Samples (MYW301 through MYW308 and MYW310)
COLLECTION DATE:	March 11 through 13, 1996
REVIEWER:	Margie D. Weiner, ESAT/Lockheed

The comments and qualifications presented in this report have been reviewed and approved by the **EPA Work Assignment** Manager (WAM) for the ESAT Contract, whose signature appears above.

If there are any questions, please contact Margie D. Weiner (ESAT/Lockheed) at (415) 954-7181, or Rose Fong (QAMS/EPA) at (415) 744-1534.

Region: 9

Regional Contact: Margie D. Weiner

Call Initiated By: _____ Laboratory __X__ Region

In reference to data for the following sample delivery group(s):
SDG No. MYW331

Summary of Questions/Issues Discussed:

The raw data for As, Pb, Se and Tl in samples MYW332, MYW333 and MYW337 indicates that Mn is over the linear range and that samples should be diluted. Form 12 on page 32 only lists the ICP linear ranges for As, Pb, Se and Tl, what is the linear range for Mn? Also, since Mn only interferes with Tl, shouldn't the results for As, Pb and Se be reported from the undiluted run? Please clarify.

Summary of Resolution:

The ICP linear range for Mn is 40,000 µg/L. The laboratory deemed it necessary to dilute samples MYW332, MYW333 and MYW337 for As, Pb, Se and TL because of the invalid interelement correction factors resulting from the high Mn results.

12. GFAA ANALYTICAL SPIKE				
13. OVERALL ASSESSMENT	Z		X	

O = Data has no problems or problems that do not affect data quality.
X = Data are qualified due to minor problems.
M = Data are qualified due to major problems.
Z = Data are unacceptable.
N/A = Not Applicable.

TPO ACTION: The results reported for selenium in all of the samples are considered unacceptable as less than 30% of the matrix spike was recovered.

TPO ATTENTION: Selenium and thallium in samples MYW332, MYW333 and MYW337 were diluted by a factor of five because the ICP linear range for manganese was exceeded. Based on the manganese concentrations found in the samples and on guidance provided in Section I, Exhibit D-1 of the Inorganic SOW, a dilution factor of two would have been more appropriate.

AREAS OF CONCERN: None.

LOCKHEED MARTIN

TABLE 1B

DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW

The definitions of the following qualifiers are prepared in accordance with the document "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review," February, 1994.

U The analyte was analyzed for, but was not detected above the level of the reported value. The reported value is either the sample quantitation limit or the sample detection limit for all the analytes except Cyanide (CN) and Mercury (Hg). For CN and Hg, the reported value is the Contract Required Detection Limit (CRDL).

L Indicates results which fall between the sample detection limit and the CRDL. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

J The associated value is an estimated quantity. The analyte was analyzed for and was positively identified, but the reported numerical value may not be consistent with the amount actually present in the environmental sample.

R The data are unusable. The analyte was analyzed for, but the presence or absence of the analyte can not be verified.

UJ A combination of the "U" and the "J" qualifier. The analyte was analyzed for but was not detected. The reported value is an estimate and may be inaccurate or imprecise.

11. SAMPLE VERIFICATION	O		O	
12. GFAA ANALYTICAL SPIKE				
13. OVERALL ASSESSMENT	X		X	

O = Data has no problems or problems that do not affect data quality.
X = Data are qualified due to minor problems.
M = Data are qualified due to major problems.
Z = Data are unacceptable.
N/A = Not Applicable.

TPO ACTION: None.

TPO ATTENTION: Arsenic, lead, selenium and thallium in samples MYW327, MYW328 and MYW329 were diluted by a factor of five because the ICP linear range for manganese was exceeded. Based on the manganese concentrations found in the samples and on guidance provided in Section I, Exhibit D-1 of the Inorganic SOW, a dilution factor of two would have been more appropriate.

AREAS OF CONCERN: Chromium was found present in the ICP interference check sample (ICS) solution A at concentrations of -4 µg/L and -6 µg/L. A true value of 21 µg/L is listed in Form 4 for chromium. Based on the low concentrations obtained for chromium in the ICP ICS solution A, the interelement correction factors and the true values of the interferents should be reevaluated.

Reviewer: Margaret L. May, ESAT/Lockheed
Date: June 4, 1996

I. Case Summary

SAMPLE INFORMATION:

VOA Samples:	YS796 through YS799, YS801, YS802, YS804, YS808, YS810, YS811, YS815, YS818, YS819, and YS820
Concentration and Matrix:	Low Level Soil
Analysis:	Volatiles
SOW:	OLM03.2
Collection Date:	March 11 and 12, 1996
Sample Receipt Date:	March 14, 1996
Analysis Date:	March 15, 18, 19, and 21, 1996

FIELD QC:

Trip Blanks (TB):	None
Field Blanks (FB):	None
Equipment Blanks (EB):	None
Background Samples (BG):	None
Field Duplicates (D1):	YS802 and YS819
(D2):	YS810 and YS820

METHOD BLANKS AND ASSOCIATED SAMPLES:

VBLKCE:	VHBLKCE
VBLKDC:	YS798, YS799, YS801, YS802, YS804, YS804MS, and YS804MSD
VBLKDD:	YS797, YS808, YS810, YS811, YS815, YS818, YS819, and YS820
VBLKDE:	YS796

TABLES:

1A:	Analytical Results with Qualifications
1B:	Data Qualifier Definitions for Organic Data Review
2:	Continuing Calibrations

TPO ACTION:

None.

TPO ATTENTION:

(1) Several detected results are qualified as nondetected and estimated (U,J) due to contamination in method and storage blanks. (2) Several results are estimated (J) due to calibration problems. (3) The results for several target analytes are estimated (J) in sample YS804 due to a low internal standard area.

SAMPLING ISSUES:

The sampler erroneously sent the Region's copy of the organic traffic report to the laboratory for samples YS796 through YS799, YS801, YS802, YS804, YS808, YS810, and YS811.

MS-Matrix Spike; MSD-Matrix Spike Duplicate; VHBLK-Storage Blank

ADDITIONAL COMMENTS:

No Tentatively Identified Compounds (TICs) were detected in the samples.

All method requirements specified in the USEPA Contract Laboratory Program (CLP) Statement of Work (SOW) for Organic Analysis, OLM03.2, have been met. This report was prepared according to the SOW and the document, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," February 1994.

III. Validity and Comments

A. The following results, denoted with an "L" qualifier, are estimated and flagged "J" in Table 1A.

- All results below the contract required quantitation limits

Results below the contract required quantitation limits (CRQLs) are considered to be qualitatively acceptable, but quantitatively unreliable, due to the uncertainty in analytical precision near the limit of detection.

B. The following detected results are qualified as nondetected and estimated due to laboratory method and storage blank contamination. The results are flagged "U,J" in Table 1A.

- Methylene chloride in samples YS796 through YS799, YS802, YS804, YS808, YS810, YS811, YS815, YS818, YS819, and YS820
- Acetone in samples YS798, YS799, YS801, YS802, YS811, and YS819

Methylene chloride was found in method blank VBLKDC and storage blank VHBLKCE. Acetone was also found in storage blank VHBLKCE. (See Table 1A for concentrations.) The results for the samples listed above are considered nondetected and estimated (U,J) and the quantitation limits have been increased according to the blank qualification rules presented below.

No positive results are reported unless the concentration of the compound in the sample exceeds 10 times the amount in any associated blank. If the sample result is greater than the CRQL, the quantitation limit is raised to the sample result (U,J). If the

sample result is less than the CRQL, the result is reported as nondetected (U,J) at the CRQL.

A laboratory method blank is laboratory reagent water, or baked sand for solid matrices, analyzed with all reagents, surrogates, and internal standards and carried through the same sample preparation and analytical procedures as the field samples. The laboratory method blank is used to determine the level of contamination introduced by the laboratory during analysis.

A storage blank is laboratory reagent water stored in a vial in the same area as the field samples. The storage blank is used to determine the level of contamination introduced by the laboratory during sample storage prior to analysis.

C. The quantitation limits for the following analytes are estimated due to large percent relative standard deviations (%RSDs) in the initial calibration. The results are flagged "J" in Table 1A.

- Chloromethane and acetone in all of the samples and method blanks VBLKDC, VBLKDD, and VBLKDE

Percent RSDs of 52.5 and 32.0 were observed for chloromethane and acetone, respectively, in the initial calibration performed March 15, 1996. These values exceed the ≤30.0% quality control (QC) advisory validation criterion.

The initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analytical sequence and of producing a linear calibration curve.

D. The quantitation limits for the following analytes are estimated due to large percent differences (%Ds) in the continuing calibrations. The results are flagged "J" in Table 1A.

- Chloromethane in samples YS796, YS797, YS808, YS810, YS811, YS815, YS818, YS819, YS820; method blanks VBLKCE, VBLKDD, VBLKDE; and storage blank VHBLKCE
- Vinyl chloride in samples YS797, YS808, YS810, YS811, YS815, YS818, YS819, YS820; method blanks VBLKCE, VBLKDD; and storage blank VHBLKCE
- Methylene chloride, carbon disulfide, and 1,1-dichloroethene in sample YS796 and method blank VBLKDE
- Acetone and 2-butanone in samples YS797, YS808, YS810, YS811, YS815, YS818, YS819, YS820, and method blank VBLKDD

Percent differences exceeding the ±25.0% QC advisory validation criterion were observed for the analytes listed above in the continuing calibrations performed March 18, 19, and 21, 1996 (see Table 2).

The continuing calibration checks the instrument performance daily and produces the relative response factors for target analytes that are used for quantitation.

E. The detected result and quantitation limits for the following analytes are estimated due to a low internal standard area. The results are flagged "J" in Table 1A.

- 4-Methyl-2-pentanone, 2-hexanone, tetrachloroethene, 1,1,2,2-tetrachloroethane, toluene, chlorobenzene, ethylbenzene, styrene, and xylene (total) in sample YS804

An internal standard area for sample YS804 fell below the QC advisory criterion, as shown below.

Sample	Internal Standard	Area	QC Limits
YS804	Chlorobenzene-d_5	859693	901208-3604834

The detected result for toluene and quantitation limits for the rest of the target analytes listed above are considered quantitatively questionable in sample YS804. Where the results are nondetected, false negatives may exist.

Internal standards, introduced into every calibration standard, blank, sample, and QC sample, monitor changes in analyte response due to matrix effects and fluctuations in instrument sensitivity throughout the analytical sequence. Internal standards are used to quantitate the concentration of target analytes and surrogate standards.

F. The matrix spike duplicate recovery and relative percent difference (RPD) for 1,1-dichloroethene in QC samples YS804MS and YS804MSD did not meet the criteria for accuracy and precision specified in the SOW. The results are presented below.

Analyte	YS804 MS %Recovery	YS804 MSD %Recovery	RPD	QC Limits RPD	QC Limits %Recovery
1,1-Dichloroethene	66	44	40	22	59-172

The results obtained may indicate poor laboratory technique, sample nonhomogeneity, or matrix effects which may interfere with accurate analysis. The effect of these results on the quality of the data is not known.

Matrix spike sample analysis provides information about the effect of the sample matrix on sample preparation and measurement.

TABLE 1B

DATA QUALIFIER DEFINITIONS FOR ORGANIC DATA REVIEW

The definitions of the following qualifiers are prepared according to the document, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," February 1994.

U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

L Indicates results which fall below the Contract Required Quantitation Limit. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Case No.: 24477 Memo #02
Site: Guyaux Landfill
Laboratory: American Technical & Analytical Services (ATAS)
Reviewer: Margaret L. May, ESAT/Lockheed
Date: June 24, 1996

I. Case Summary

SAMPLE INFORMATION:

VOA Samples:	YS794, YS795, YS800, YS803, YS805, YS806, YS807, YS809, YS812, YS813, YS814, YS816, YS817, and YS821
Concentration and Matrix:	Low Level Soil
Analysis:	Volatiles
SOW:	OLM03.2
Collection Date:	March 13, 1996
Sample Receipt Date:	March 15, 1996
Analysis Date:	March 19, 20, 21, and 22, 1996

FIELD QC:

Trip Blanks (TB):	None
Field Blanks (FB):	None
Equipment Blanks (EB):	None
Background Samples (BG):	YS794 and YS795
Field Duplicates (D1):	YS814 and YS821

METHOD BLANKS AND ASSOCIATED SAMPLES:

VBLKCF:	VHBLKCF
VBLKDE:	YS794, YS795, YS800, YS803, YS805, YS806, and YS807
VBLKDF:	YS813, YS816, YS816MS, and YS816MSD
VBLKDG:	YS809, YS812, YS813RE, YS814, and YS821
VBLKDH:	YS814RE and YS817

TABLES:

1A:	Analytical Results with Qualifications
1B:	Data Qualifier Definitions for Organic Data Review
2:	Continuing Calibrations

TPO ACTION:

None.

TPO ATTENTION:

(1) Several detected results are qualified as nondetected and estimated (U,J) due to contamination in method and storage blanks. (2) Numerous results are estimated due to calibration problems. (3) The results in several samples are estimated due to low internal standard areas.

SAMPLING ISSUES:

None.

MS - Matrix Spike; MSD - Matrix Spike Duplicate;
VHBLK - Storage Blank; RE - Reanalysis

ADDITIONAL COMMENTS:

Toluene was detected in background sample YS794 at a concentration of 38 µg/Kg.

A temperature of 9 °C was measured for the temperature blank associated with all of the samples upon receipt at the laboratory on March 15, 1996. This temperature exceeds the 4 °C ±2 °C sample preservation criterion.

The Tentatively Identified Compounds (TICs) found in the samples are reported on the Form 1Es included in this report. No TICs were detected in samples YS794, YS803, YS805, YS806, YS807, YS812, YS813, YS814, YS816, YS817, and YS821.

All method requirements specified in the USEPA Contract Laboratory Program (CLP) Statement of Work (SOW) for Organic Analysis, OLM03.2, have been met.

This report was prepared according to the SOW and the document, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," February 1994.

III. Validity and Comments

A. The following results, denoted with an "L" qualifier, are estimated and flagged "J" in Table 1A.

- All results below the contract required quantitation limits

Results below the contract required quantitation limits (CRQLs) are considered to be qualitatively acceptable, but quantitatively unreliable, due to the uncertainty in analytical precision near the limit of detection.

B. The following detected results are qualified as nondetected and estimated due to method and storage blank contamination. The results are flagged "U,J" in Table 1A.

- Methylene chloride in samples YS794, YS795, YS800, YS803, YS805, YS806, YS807, YS809, YS812, YS813, YS814, YS817, and YS821
- Acetone in samples YS794, YS795, YS800, YS803, YS805, YS806, YS817, and YS821

Methylene chloride was found in method blanks VBLKDG and VBLKDH and storage blank VHBLKCF. Acetone was also found in method blank VBLKDF. (See Table 1A for concentrations.) The results for the samples listed above are considered nondetected and estimated (U,J) and the quantitation limits have been increased according to the blank qualification rules presented below.

No positive results are reported unless the concentration of the compound in the sample exceeds 10 times the amount in the associated blank. If the sample result is greater than the CRQL, the quantitation limit is raised to the sample result (U,J). If the sample result is less than the CRQL, the result is reported as nondetected (U,J) at the CRQL.

A laboratory method blank is laboratory reagent water analyzed with all reagents, surrogates, and internal standards and carried through the same sample preparation and analytical procedures as the field samples. The laboratory method blank is used to determine the level of contamination introduced by the laboratory during analysis.

A storage blank is laboratory reagent water stored in a vial in the same area as the field samples. The storage blank is used to determine the level of contamination introduced by the laboratory during sample storage prior to analysis.

C. The detected result and quantitation limits for the following analytes are estimated due to large percent relative standard deviations (%RSDs) in the initial calibration. The results are flagged "J" in Table 1A.

- Chloromethane and acetone in samples YS794, YS795, YS800, YS803, YS805, YS806, YS807, YS813, YS816 and method blanks VBLKDE and VBLKDF

Percent RSDs of 52.5 and 32.0 were observed for chloromethane and acetone, respectively, in the initial calibration performed March 15, 1996. These values exceed the ≤30.0% QC advisory validation criterion.

The initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of the analytical sequence and of producing a linear calibration curve.

D. The detected results and quantitation limits for the following analytes are estimated due to large percent differences (%Ds) in the continuing calibrations. The results are flagged "J" in Table 1A.

- Chloromethane in samples YS794, YS795, YS800, YS803, YS805, YS806, YS807, YS813, YS816; method blanks VBLKCF, VBLKDE, VBLKDF; and storage blank VHBLKCF
- Methylene chloride, carbon disulfide, and 1,1-dichloroethene in samples YS794, YS795, YS800, YS803, YS805, YS806, YS807, and method blank VBLKDE

Percent differences exceeding the ±25.0% QC advisory validation criterion were observed for the analytes listed above in the continuing calibrations performed March 19, 20, and 22, 1996 (see Table 2).

The continuing calibration checks the instrument performance daily and produces the relative response factors for target analytes that are used for quantitation.

E. The quantitation limits for the following analytes are estimated due to low internal standard areas. The results are flagged "J" in Table 1A.

- Chloromethane, bromomethane, vinyl chloride, chloroethane, methylene chloride, acetone, carbon disulfide, 1,1-dichloroethene, 1,1-dichloroethane, 1,2-dichloroethene (total), chloroform, 1,2-dichloroethane, and 2-butanone in samples YS813 and YS816
- 4-Methyl-2-pentanone, 2-hexanone, tetrachloroethene, 1,1,2,2-tetrachloroethane, toluene, chlorobenzene, ethylbenzene, styrene, and xylene (total) in sample YS814

The internal standard areas for samples YS813, YS814, and YS816 fell below the QC advisory criteria, as shown below.

Sample	Internal Standard	Area	QC Limits
YS813	Bromochloromethane	130835	198134-792538
YS814RE	Chlorobenzene-d_5	895604	980112-3920450
YS816	Bromochloromethane	167620	198134-792538

The nondetected results for samples YS813, YS814, and YS816 are quantitatively questionable. Since the results are nondetected, false negatives may exist.

Samples YS813 and YS814 were reanalyzed due to the low internal standard areas. The results from the original analysis of sample YS813 and the reanalysis of sample YS814 are presented in Table 1A in order to minimize the number of qualified data points. Low internal standard areas were also observed in the analysis of QC samples YS816MS and YS816MSD.

Internal standards, introduced into every calibration standard, blank, sample, and QC sample, monitor changes in analyte response due to matrix effects and fluctuations in instrument sensitivity throughout the analytical sequence. Internal standards are used to quantitate the concentration of target analytes and surrogate standards.

F. The matrix spike and matrix spike duplicate recoveries for 1,1-dichloroethene in QC samples YS816MS and YS816MSD did not meet the criteria for accuracy specified in the SOW. The recoveries are presented below.

Analyte	YS816MS %Recovery	YS816MSD %Recovery	QC limits %Recovery
1,1-Dichloroethene	52	58	59-172

The results obtained may indicate poor laboratory technique or matrix effects which may interfere with accurate analysis. Since these recoveries do not greatly exceed the QC limits, no adverse effect on the quality of the data is expected.

Matrix spike sample analysis provides information about the effect of the sample matrix on sample preparation and measurement.

TABLE 1B

DATA QUALIFIER DEFINITIONS FOR ORGANIC DATA REVIEW

The definitions of the following qualifiers are prepared according to the document, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," February 1994.

U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

L Indicates results which fall below the Contract Required Quantitation Limit. Results are estimated and are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of detection.

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Summary of Questions/Issues Discussed:

The following items are for your information only. Please complete Form DC-2 following Section 3.20 of Exhibit B of OLM03.2 in future data package submittals.

(1) The lab column spaces for item 1 and item 4.a (Form V VOA) of Form DC-2-1 were not checkmarked.

(2) The pagination range for item 4.c should be 173 to 255 in Form DC-2-1.

(3) The pagination range for item 4.d should be 256 to 277 in Form DC-2-1.

Summary of Resolution:

No response is required of the laboratory.

Re: Duplicate Sample Designation for Guyaux Landfill Field Sampling Event

Dear Mr. Eidelberg:

During our telephone conversation on May 24, 1996, I informed you that the following Field QA/QC Summary Form dated March 20, 1996 contained incorrect information regarding duplicate samples:

Site: Guyaux Landfill (CAD 983562033)
RAP Number: R96S35
Laboratory: EPA Region IX Laboratory
Matrix: Water
Analysis: Low-level arsenic

Section IV (Duplicates) incorrectly states that Sample SYJ 209 matches Sample SYJ 208. The form should state that Sample SYJ 208 matches Sample SYJ 207. Sample SYJ 209 is the performance evaluation sample, as stated on the Field QA/QC Summary Form. I have attached a copy of the certified values for the performance evaluation sample, which was prepared by Environmental Resource Associates of Arvada, Colorado.

If you have any questions, you may contact me at (415) 768-6496.

Sincerely,

Gregory R. Carroll
Site Leader

Thallium	20.6	14.5 - 26.8
Zinc	150	127 - 183

The **Performance Acceptance Limits (PALs™)** are listed as guidelines for acceptable analytical results given the limitations of the USEPA methodologies commonly used to determine these parameters and closely approximate the 95% confidence interval. The PALs™ are based on the regulated acceptance limits as published by the EPA in the Federal Register, data generated by your peer laboratories in ERA's InterLaB™ program using the same samples you are analyzing and data from USEPA methods and WS interlaboratory studies. If your result falls outside of the PAL™, ERA recommends that you investigate potential sources of error in your preparation and/or analytical procedures. For further technical assistance, call ERA at 1-800-372-0122.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Ninyo & Moore were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

SUBJECT: WORK PLAN FOR PHASE II ENVIRONMENTAL SITE ASSESSMENT, GUYAUX WASTE DISPOSAL SITE (SWIS NO. 36-CR-0025)

Dear Mr. Martin:

On January 31, 2017, the Local Enforcement Agency (LEA) of San Bernardino received the Work Plan for Phase II Environmental Site Assessment (ESA) for Guyaux Waste Disposal Site, Terminus of South Florez and Fernando Streets, Colton, California 92324 (SWIS No. 36-CR-0025). The plan presents procedures for conducting the Phase II ESA that will evaluate the locations, types, and extent of wastes related to the waste disposal site.

San Bernardino County LEA and CalRecycle have reviewed the proposed work plan. With guidance from CalRecycle, the LEA has determined that Guyaux Waste Disposal Site may proceed with the proposed plan with the following provision:

- ✓ If during the intrusive investigation it is determined that there has been waste deposited that has the potential to produce gas, then landfill gas probes should be constructed at the property boundary adjacent to the homes.

If you have any questions or comments please contact me, Yong Aday of San Bernardino County LEA at (800) 442-2283 or by e-mail at: yong.aday@dph.sbcounty.gov.

Sincerely,

Yong Aday, REHS II

Dear Mr. Martin:

Ninyo & Moore is pleased to submit this Phase II Environmental Site Assessment (ESA) report to Phil Martin & Associates that focused on evaluating the locations, types, and extent of wastes at the Guyaux Waste Disposal Site generally within the boundaries of the proposed Colton Regional Soccer Complex Redevelopment project in Colton, California. The Phase II ESA was conducted in accordance with the above-referenced County of San Bernardino, Department of Public Health (acting as the Solid Waste Local Enforcement Agency) - approved work plan and applicable regulatory guidelines and regulations.

We appreciate the opportunity to work with you on this project.

Respectfully submitted,
NINYO & MOORE

EXECUTIVE SUMMARY

The City of Colton (City) in San Bernardino County, California, is proposing a 30.5 acre regional soccer complex and community park referred to as the Colton Regional Soccer Complex Redevelopment project (Project). The Guyaux Waste Disposal Site (WDS) consists of approximately 4 acres that is located within the central portion of the Project. In March 2017, as part of the proposed Project, a Phase II Environmental Site Assessment (ESA) was conducted at the WDS that consisted of delineating and characterizing the wastes within the Project boundary.

The WDS is located in an area of mixed industrial and residential uses and open space. To the adjacent west is a concrete company, to the south and east are open space and the Santa Ana River, and to the adjacent north are residential properties with both South Florez and South Fernando Streets terminating to the south at the WDS. The surface expression of the WDS generally consists of a roughly circular-shaped mounded area that slopes to the east, south and southwest. Recent topographic survey data indicates ranges in elevation from approximately 929 to 933 feet above mean sea level (MSL) at the top, to approximately 915 to 920 feet MSL at the base of the slopes. The site is bordered to the west by an industrial property (Largo Concrete, Inc.) and railroad tracks; to the north by residential properties; and to the east and south by the flood plain and the Santa Ana River.

The City property or Project (30.5 acres) which includes the approximately 4-acre WDS, consists of three undeveloped, vacant parcels, totaling approximately 30.5 acres. These parcels, zoned as open space, are as follows:

- Assessor's Parcel Number 0163-362-26, consisting of 13 acres.
- Assessor's Parcel Number 0163-381-01, consisting of 6.5 acres.
- Assessor's Parcel Number 0163-381-02, consisting of 11 acres.

According to the California Department of Resources Recycling and Recovery (CalRecycle) Solid Waste Information System (SWIS) database, the Guyaux WDS is a closed, pre-regulation solid waste disposal site (e.g., predates regulations for solid waste disposal sites). The site reportedly ceased operations in December 1985 and is assigned No. 36-CR-0025. According to

the SWIS database, there are no inspections or enforcement action records for 36-CR-0025 issued by the County of San Bernardino, Department of Environmental Health, acting as the Solid Waste Local Enforcement Agency (LEA).

From 1989 to 2010, numerous investigations were conducted at the WDS. Background information from these investigations indicated that in the late 1930s, construction debris such as used bricks, concrete, asphalt, steel, wood, and other deleterious materials generated from the flooding of the City in 1938 were disposed. In the late 1950s, the WDS was used to store used bricks which were cleaned and re-sold for construction activities. The waste products generated from the used brick cleaning reportedly were used as fill at the WDS. In the 1970s and 1980s, the WDS was used as a waste disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company (Bechtel, 1996). Background documents and reports indicate that in 1977, the site began to accept "black slag" iron waste from the Griffin Wheel Company (Weston, 1993). Materials disposed of at the WDS reportedly included construction debris, plaster molds, broken porcelain, and waste foundry slag. Reportedly, these waste materials were disposed of directly onto the exposed soil surface. Steel and wood beams were also stored at the WDS for reuse until the mid-1980s (Weston, 1993). From approximately 1985 to the mid-1990s, the WDS was used to temporarily store automobiles and machinery prior to reuse (Environmental Engineering & Contracting, Inc. [EEC], 2010). The descriptions of the types of wastes disposed of at the Guyaux WDS are generally consistent with what was observed in the trench excavations.

At the time of the subject Phase II ESA, the WDS was observed to be accessible from surface streets to the north (South Florez and South Fernando Streets) and by unpaved dirt roads located at the eastern and southern perimeter of the waste disposal area. A small portion of fencing exists in the terminus of South Florez Street with a locking gate; however, the fence is damaged and the WDS is accessible to the public.

In March, 2017, Ninyo & Moore conducted a Phase II ESA of the Guyaux WDS within the Project boundary for the purposes of characterizing and delineating wastes and to evaluate the potential presence of cover overlying wastes, as applicable, provide an estimate of the in-place

volume of wastes based on locations explored, and to conduct sufficient analytical testing to generally characterize the wastes. The investigation included excavating, logging, sampling and documenting 21 trench excavations within the Project site and one trench excavation on the adjacent, offsite, vacant property to the north (total of 22 exploratory trenches). Due to extreme caving of most trench excavations because of the relatively loose fill soil mixed with waste, much of which consisted of large pieces of debris and the total waste depths (WDS conditions), 13 trenches were extended into the underlying alluvium. Based on conversation with CalRecycle and LEA staff while conducting the Phase II ESA, due to these WDS conditions, they requested that at least one, and if possible, two to three trenches be excavated to the total depth of wastes and into the alluvium, as possible. Locations of trench excavations were based on review of historical aerial photographs, locations of observed surface wastes, and the geophysical survey. Authoritative protocol was used in the field to adjust and identify locations of exploratory trenches to optimize delineation of waste areas as the investigation proceeded. During the exploratory trenching, groundwater was not encountered.

Concurrent with the Phase II ESA, a geophysical survey was conducted to generally evaluate the locations and lateral extent of the WDS. In general, the geophysical survey delineated the extent of wastes and indicated the presence of anomalous conditions in the area of the waste disposal. The results of the geophysical survey related to the lateral extent of wastes correlated well with the extent of the wastes as delineated during this investigation.

Based on the 22 exploratory trenches, waste was observed at depths ranging from the surface to approximately 19 feet below ground surface (bgs). In general, two types of wastes were observed: construction debris and metal wastes. The construction debris generally consisted of concrete, brick, plaster mold, insulations, tile, wood, toilet, and asphalt which based on background information, appears to be related to historical City flooding and brick cleaning. The metal wastes generally consisted of metal disk molds, slag and what appears to be darkly colored soils/metallic dust (and plaster molds), which based on background information appears to be related to wastes generated from the Griffin Wheel Company and porcelain molds from the

Crane Company and disposed of at the WDS. Based on the site reconnaissance and trench excavations, metal and construction wastes were observed to be exposed at the surface.

Based on wastes observed in trenches located at the Project boundaries, and the one trench on the vacant lot to the adjacent north, field observations and information provided by residences in the area, it appears that wastes extend beyond the Project. More specifically, based on waste thicknesses at trenches located at the Project boundaries with residential properties, wastes likely extend offsite and to the north onto residence(s) west of South Fernando Street and to residences both west and east of South Florez Street. Wastes were observed in the trench excavation on the vacant lot to the north of the Project boundary. To the adjacent north of the vacant lot, two residential properties are currently undergoing construction. Based on conversation with a representative of the two properties under construction, the construction debris stockpile located to the adjacent east was generated during excavation of footings down to 4 feet bgs, indicating wastes extend to these properties. In addition, a nearby resident indicated that debris extended at least to the location of the water pump station approximately two houses north of the Project boundary, on the east side of South Florez Street. Based on trenches at the western Project area, wastes likely also extend offsite to the west, onto an industrial property (Largo Concrete, Inc.).

Based on the locations explored, results of the geophysical survey correlating well with the lateral extent of wastes, and historical aerial photograph interpretation, the lateral extent of wastes was estimated to be approximately 183,000 square feet (ft^2). Assuming an average waste thickness of approximately 15.5 feet, corresponds to an estimated approximately 105,000 cubic yards (cy) of wastes. This estimated volume is for the wastes within the Project boundaries only, and does not include wastes that likely, or are known, (vacant lot), to extend offsite onto residential properties to the north and onto the commercial property to the west. Within the Project, wastes were observed to be exposed at the surface and were at the surface at each trench location; indicating the absence of waste cover soil or a cap.

Regarding the ongoing construction of residential properties to the north of the site, although not known, the LEA is required to be notified if wastes are planned to be disturbed at the WDS or

within 1,000 feet. Typically, construction of residences on wastes requires regulatory involvement and additional local building requirements.

Analytical results of samples were compared to applicable screening levels and hazardous waste criteria as discussed below.

Title 22 Metals

- Arsenic concentrations in samples ranged from 1.56 to 13.9 milligrams per kilogram (mg/kg) with the majority of samples exceeding the residential and industrial regional screening levels (RSLs) as well as the Department of Toxic Substances Control (DTSC), Human and Ecological Risk Office (HERO) residential and industrial screening levels. Background arsenic concentrations in three samples outlying wastes were higher concentrations than the residential and industrial RSLs. Arsenic was detected in samples collected from alluvium at concentrations greater than the industrial RSL of 3 mg/kg in 7 of 15 samples with the majority of samples exceeding the residential and industrial DTSC HERO screening levels. However, background arsenic concentrations which were detected above 3 mg/kg are higher than the residential/industrial RSL and DTSC HERO screening levels. It is recommended that the background concentration of 12 mg/kg established by the DTSC for use on school sites be used for the WDS. Two of the waste samples exceeded the DTSC background concentration.

- Cadmium was detected in two waste samples at concentrations exceeding 10 times the Soluble Threshold Limit Concentrations (STLC) value, thereby classifying this material as potentially hazardous waste with respect to cadmium. Cadmium concentrations in samples analyzed were less than the residential and industrial RSLs and the DTSC HERO residential and industrial screening levels.

- Chromium concentrations in waste samples exceeded 10 times the STLC value, in 15 samples and twenty times the Toxicity Characteristic Leaching Procedure (TCLP) value, in 13 samples, thereby classifying these materials as potentially hazardous with respect to chromium. Total chromium was detected in grab samples GS-1 (metal disc) and GS-2 (vesicular metal slag) at concentrations exceeding 10 times the STLC chromium value, and one sample exceeded 20 times the TCLP value, thereby classifying these materials as potentially hazardous waste with respect to chromium. Chromium concentrations in samples analyzed were less than the DTSC HERO industrial screening level.

- The lead concentrations in most waste samples exceed the residential and industrial RSLs of 400 and 800 mg/kg, respectively. Thirty-one waste samples contained lead at concentrations exceeding the DTSC HERO residential screening level of 80 mg/kg and 11 samples exceeded the DTSC HERO industrial screening level of 320 mg/kg. Two samples contained lead at concentrations exceeding the Total Threshold Limit Concentration (TTLC) of 1,000 mg/kg, thereby classifying these materials as California hazardous waste with respect

to lead. Lead concentrations exceeded 10 times the STLC value in 38 samples and 20 times the TCLP value in 27 samples, thereby classifying these materials as potentially hazardous with respect to lead. A sample with the highest lead concentration was additionally analyzed for Synthetic Precipitation Leaching Procedure (SPLP) and TCLP. The SPLP and TCLP lead concentrations were detected at 0.151 and 1.06 milligrams per liter (mg/l), respectively. The TCLP lead concentration of 1.06 mg/l did not exceed the lead concentration of 5 mg/l, thereby classifying this material as a California hazardous waste. The SPLP lead concentration of 0.151 mg/l is greater than the lead maximum contaminant level (MCL) of 0.015 mg/l by an order of magnitude and could be interpreted as a potential threat to drinking water resources. The lead concentration in one of the 15 samples analyzed from the alluvium underlying the wastes was at a concentration of 10 times the STLC value, thereby classifying this material as potentially hazardous with respect to lead. However, one of the background samples collected at a location outlying wastes also contained lead at a concentration of 10 times the STLC. Based on this and the lead results of the other 14 alluvium samples, it appears that the underlying alluvium is not impacted by lead related to the wastes.

- Nickel concentrations exceeded 10 times the STLC value in two waste samples (T-13-2 and T-13-8), thereby classifying these materials as potentially hazardous with respect to nickel. Nickel concentrations in samples analyzed were less than the residential and industrial RSLs and the DTSC HERO residential and industrial screening levels.

- Thallium was detected at concentrations above the residential RSL in two waste samples. Thallium concentrations in samples analyzed were less than the industrial RSL.

Total Petroleum Hydrocarbons (TPH)-diesel concentrations of the four samples was significantly less than the typical regulatory action level.

Polychlorinated Biphenyl (PCBs)-1260 was the only PCB detected in one sample at a concentration which exceeded the residential and industrial RSLs.

Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs) and Organochlorine Pesticides (OCPs) were not detected at concentrations above their respective laboratory reporting limits.

Based on background information and results of this Phase II ESA, the following is recommended at this time.

- This Phase II ESA report should be submitted to the LEA and CalRecycle for their review and comments.

- To the north of the WDS, several existing residential properties, the two residential properties currently undergoing construction, and the vacant lot appear to overlie wastes. The LEA should be notified of the suspected lateral extent of the wastes. In addition, the LEA is required to be notified of any actions that result in the disturbance of wastes or of any project in which the subsurface will be disturbed within 1,000 feet of a WDS. Based on this, although not known, the LEA should have been notified of the current residential construction projects.

- Current conditions at the WDS indicates that at most locations, wastes are exposed at the surface. Analytical results of samples analyzed during this investigation indicated hazardous concentrations of some constituents of potential concern (COPC) at the surface and at shallow depths. These wastes should be immediately covered to meet the requirements of California Code of Regulations (CCR) Title 27, Section 21140 - Final Cover for the protection of public health and safety. Such a cover would require approval by the LEA and/or CalRecycle prior to construction and likely submittal of a Post Closure Land Use (Plan) or similar plan. The WDS should be restricted from public access, per CCR Title 27 Section 21135; this would be best accomplished by construction of a perimeter fence. Signage should be posted on the perimeter fencing to further restrict public access.

- Although not investigated, it appears some residential properties to the north and one commercial property to the west overlie wastes. Construction or development of properties that are the locations of waste disposal requires notification to the LEA and possibly other regulatory agencies prior to beginning construction/development. Regulatory agencies typically have requirements for such projects for the protection of human health and the environment and to meet applicable regulatory requirements. In addition, lead was detected in a sample from the trench excavated on the vacant parcel to the north at a concentration exceeding residential and industrial RSLs and exceeding hazardous waste criteria and stockpiled wastes are present east of the two properties currently being developed with homes. It is recommended that the LEA be notified in writing of the conditions of the WDS and the construction projects overlying wastes.

- The City should be informed of the requirements for this WDS by discussing the results of this investigation with LEA and/or CalRecycle staff.

- Although based on the types of wastes (primarily inert construction debris and metallic debris), absence of municipal solid wastes, and absence of VOCs and SVOCs in samples analyzed; because wastes appear to underlie residential properties and the proximity of other residences and an industrial business west of the WDS, the LEA may require a landfill gas investigation. Such an investigation would likely consist of constructing and monitoring landfill gas wells. In addition, the LEA may have requirements related to the construction of residential properties overlying wastes (e.g., passive venting).

- The LEA may want to resume quarterly inspections of the Guyaux WDS based on the current site conditions.

1. INTRODUCTION

The City of Colton (City) is proposing to construct a 30.5-acre regional soccer complex. The proposed park is planned to be accessible from Congress Street and will be located adjacent to and north of the Santa Ana River flood plain. The Guyaux Waste Disposal Site (WDS) consists of approximately 4 acres located within the central portion of the Colton Regional Soccer Complex Redevelopment project (Project); however, wastes extend beyond the Project boundary. Background information indicates that the WDS was historically used for waste disposal of construction debris such as used bricks, concrete, iron waste (slag), plaster molds, rubber, steel, wood, and other deleterious materials (Bechtel, 1996). The WDS is located immediately south of the termination of South Florez and South Fernando Streets in the City of Colton, California (Figure 1).

The Guyaux WDS is identified in the California Department of Resources, Recycling and Recovery (CalRecycle) Solid Waste Information System (SWIS) database and is assigned No. 36-CR-0025. Based on information contained in the SWIS database, the site is a pre-regulations, closed waste disposal site that reportedly ceased operations in December 1985. Waste types are listed as industrial, inert and metals.

This report describes the Phase II Environmental Site Assessment (ESA) conducted at the Guyaux WDS to characterize and delineate the lateral and vertical extent of the wastes, evaluate the potential presence of cover or a cap and provide a waste volume estimate. The results of this Phase II ESA will be used to assist with evaluating appropriate remedial actions related to the planned Project. The current planned remedial action is to cap/cover the wastes so the City can construct the soccer complex and community park. The Phase II ESA activities were conducted in general accordance with the approved work plan and applicable regulatory requirements and guidance documents.

2. PROJECT OBJECTIVES

The primary objectives of the Phase II ESA were as follows:

- Delineate the lateral and vertical extent of the wastes, thicknesses, and chemical characteristics.
- Provide an estimate of the in-place volume of wastes within the Project boundary based on locations explored; and
- Evaluate the potential presence, thicknesses, and quality of the cover material, if present.

The information obtained from the Phase II ESA will assist with developing an appropriate remedial action plan for the WDS consistent with the planned soccer complex and community park. The current planned remedial action is to cover or cap the existing wastes. The Phase II ESA activities were conducted in general accordance with this work plan, applicable regulatory requirements and guidance documents, and requests by CalRecycle and/or the Local Enforcement Agency (LEA).

3. RESPONSIBLE AGENCY

Ninyo & Moore was responsible for preparing the work plan for the Phase II ESA (Ninyo & Moore, 2016), conducting the Phase II ESA, and preparing this Phase II ESA report. Copies of the work plan were provided to Ms. Dawn Plantz at CalRecycle, Ms. Diana Almond at the LEA, and Ms. Deb Farrar at the City of Colton for their reviews, and LEA approval. Due to County of San Bernardino's loss of staff at the time, CalRecycle assisted the LEA by being the primary reviewer of the work plan and providing comments. The LEA approved the work plan in a letter, dated March 14, 2017, prepared by the LEA based on reviews by both CalRecycle and the LEA (see Appendix A). The LEA is the lead regulatory agency for this project.

4. SITE LOCATION AND DESCRIPTION

The Guyaux WDS is a roughly circular mound shaped area that slopes to the east, south and southwest. The top of the waste slope extends from the southern terminus of South Florez and South Fernando Streets (Figure 2). The WDS within the Project boundary consists of approximately 4 acres; however, based on background information and results of this investigation, the WDS extends offsite to the north and west.

The surface expression of the WDS generally consists of a roughly circular-shaped mounded area that slopes to the east, south and southwest. An unpaved dirt road generally delineates the south, east and a portion of the western perimeter of the WDS. Recent topographic survey data indicates ranges in elevation from approximately 929 to 933 feet above mean sea level (MSL) at the top, to approximately 915 to 920 feet MSL at the base of the slopes. The site is bordered to the west by an industrial property (Largo Concrete, Inc.) and railroad tracks, to the north by residential properties, and to the east and south by the flood plain and the Santa Ana River (Figures 3 and 4).

The City property (30.5 acres) which includes the approximately 4-acre WDS, consists of three undeveloped, vacant parcels, totaling approximately 30.5 acres. These parcels, zoned as open space, are as follows:

- Assessor's Parcel Number 0163-362-26, consisting of 13 acres.
- Assessor's Parcel Number 0163-381-01, consisting of 6.5 acres.
- Assessor's Parcel Number 0163-381-02, consisting of 11 acres.

At the time of the subject Phase II ESA, the WDS was observed to be accessible from surface streets to the north (South Florez and South Fernando Streets) and by unpaved dirt roads located at the eastern and southern perimeter of the waste disposal area. A small portion of fencing exists in the area of South Florez Street with a locking gate; however, the fence is damaged and the WDS is accessible to the public.

An unlocked monitoring well was observed at the base of the WDS on the south and three locked or abandoned monitoring wells were observed at various locations at the site (Figure 3).

During the April 26, 2016 reconnaissance and the March 21-23, 2017, Phase II ESA focusing on the WDS, wastes/debris, including concrete, bricks, wood, and metal slag and metal disks and darkly colored soils were observed at the surface of the WDS. During the Phase II ESA, two residential properties were undergoing construction north of the WDS. Relatively large piles of concrete and brick debris, up to approximately 7 feet high were observed offsite and east of the

southernmost residential property. Based on conversation with a representative of the two properties under construction, the construction debris stockpile located to the adjacent east was generated during excavation of footings down to approximately 4 feet below ground surface (bgs), indicating wastes extend to these properties. In addition, a nearby resident indicated that debris extended at least to the location of the water pump station approximately two houses north of the Project boundary, on the east side of South Florez Street. Based on trenches explored at the western Project area, wastes likely also extend offsite to the west, onto an industrial property (Largo Concrete, Inc.).

The site is bordered to the west by an industrial property (Largo Concrete, Inc.) and railroad tracks; to the north by residential properties; and to the east and south by the flood plain and the Santa Ana River.

5. OWNERSHIP AND OPERATORS

The following information for the WDS was generally obtained from SWIS database (see Appendix B) and City of Colton:

Site:	Guyaux Waste Disposal Site
Location:	Northern WDS boundary extends beyond the southern terminus of South Florez and South Fernando Streets, Colton California
GIS Coordinates:	34.05368; 117.322178 (CalRecycle SWIS Database)
SWIS No.:	36-CR-0025
Operator:	No information provided
Contact:	Ms. Deb Farrar, Acting Director of Community Services
Land Owner:	Mr. Ralph Guyaux (CalRecycle, SWIS database)
Current Land Owner:	City of Colton, Development Services Department

6. BACKGROUND AND SITE HISTORY

According to a 1993 interview with the site owner, Mr. Ralph Guyaux, by Roy F. Weston, Inc. (Weston) as part of their Preliminary Assessment (PA) Report for the United States

Environmental Protection Agency (EPA), the site was used in the late 1930s for disposal of construction debris generated from the flooding of the City of Colton in 1938. In the late 1950s, the site was used to store used bricks which were then cleaned and re-sold for construction activities. The waste products generated from the used brick cleaning were used as fill on the site (Weston, 1993).

Background information indicated that in 1966, the site was purchased by Mr. Robert Zandberen from Mr. Henry Adams. In 1973, Mr. Ralph Guyaux began a "20-year purchase" of the property, which previously had an agreement with the Crane Company to accept plaster molds from the production of bathroom fixtures and broken porcelain (start date of waste acceptance not reported). In 1977, the site began to accept "black slag" from the Griffin Wheel Company (Weston, 1993).

According to a letter from the Santa Ana Regional Water Quality Control Board (RWQCB) addressed to Mr. Guyaux, dated November 16, 1977, the RWQCB analyzed a leachate sample of the molding material from the Crane Company, found the material to be "significantly soluble in water," and requested that Mr. Guyaux not accept further wastes from the Crane Company. The RWQCB also requested that waste should not be accepted from the Griffin Wheel Company under the assumption that a leachate analysis of the "black ash material" (slag) would "also have similar results." The RWQCB requested that the "black ash material" be analyzed and a Waste Discharge Report be submitted.

In a letter to the RWQCB, dated January 27 1978, Mr. Guyaux submitted a partially completed Waste Discharge Report (dated December 29, 1977) and indicated Colton Manufacturing (Crane Company) had been notified that molds and fixtures were no longer permitted to be disposed of at the site. Mr. Guyaux also indicated black ash material from Griffin Wheel had not been disposed of at the site for six months and that he had collected a sample of the material for analysis. In 1981, Mr. Guyaux indicated the "ash material" analytical results were either never reported or lost. However, according to an interview conducted by Weston as part of their PA in 1993, Mr. Guyaux stated he never collected a waste sample because the RWQCB wouldn't issue him a permit to operate the landfill. He also indicated the site stopped accepting wastes in 1981

when directed to do so by the RWQCB, however Weston reported waste disposal ceased by 1985.

Bechtel (1996) stated that in the 1970s and 1980s, the WDS was used as a materials recycling disposal yard for waste materials generate at the Griffin Wheel Company and the Crane Company. Materials disposed of on-site included construction debris, plaster molds, broken porcelain, and waste foundry slag. Reportedly, these materials apparently were disposed of on exposed soil. Steel and wood beams were also stored on the site for reuse until the mid-1980s (Weston, 1993). From approximately 1985 to the mid-1990s, the site was used to temporarily store automobiles and machinery prior to reuse (EEC, 2010).

In 1985, the RWQCB requested a groundwater monitoring program for the WDS and in 1988, a Solid Waste Assessment Test. Mr. Guyaux did not comply with these requests. In the interview, Mr. Guyaux also stated that the waste slag from Griffin Wheel Company consisted of "a few loads," was not used as fill, and was left in visible piles on the surface of the site. Weston reported that they observed approximately 10 piles of solid waste material (slag) from Griffin Wheel Company during their site reconnaissance. Weston indicated "it is unknown if any of this material was also buried at the site and there are no records indicating how long these materials were deposited at the site, or in what quantities (Weston, 1993).

Previous investigations indicated that the WDS may have been regraded sometime in the mid-1990s indicating that the actual vertical extent of the WDS may extend beyond the limits.

7. HISTORICAL AERIAL PHOTOGRAPHS AND TOPOGRAPHIC MAPS

Historical aerial photographs dating from 1938 through 2012 and historical topographic maps dating from 1896 through 2012 were reviewed to obtain background information about the WDS (Appendix C). The summary below is an interpretation of the photographs and is focused on information that may be relevant to the subject planned Phase II ESA related to the WDS and is not intended to be a complete description of all historical site conditions. Although off site, an objective of the historical aerial photograph review was to identify whether wastes may underlie

residential properties located at the southernmost extent of South Florez and South Fernando Streets.

1938 Aerial Photograph – The 1938 photograph indicates the site as undeveloped land. The flooded Santa Ana River, trending northeast to southwest has inundated the majority of the site. Some agricultural and residential properties are located north-northwest of the site. North to south trending, unpaved, South Florez and South Fernando Streets appear as dirt roads to the adjacent north of the site. The Southern Pacific railroad tracks are located west of the site.

1949 Aerial Photograph – The site remains undeveloped in the 1949 aerial photograph. The Santa Ana River appears dry; however the site still shows the effects of being inundated by the river. Trees and other vegetation delineate the northwestern extent of the flooded area. Additional residential properties appear to the north of the site at the terminus of unpaved South Florez and South Fernando Streets.

1953 Aerial Photograph – The site continues to be undeveloped in the 1953 aerial photograph. The northwestern portion of the site appears to contain increased vegetation and the southwestern extent appears to remain as a dry riverbed area. Additional residential properties are located along South Florez and South Fernando Streets, with several homes located south of the terminus of these unpaved streets.

1959 Aerial Photograph – The site remains undeveloped. A stream/river related to the Santa Ana River Channel traverses the site from northeast to southwest at the southern portion of the site. Some fill material appears to extend from off site onto the northwestern most corner of the site and stockpiled material appear to be located near the terminus of South Florez Street on the east side and at the current location of off site residential properties. Although not clear, there appears to be some surface disturbances at the northeastern site area, south of the terminus of South Fernando Street.

1966 Aerial Photograph – The 1966 aerial photograph is grainy with poor resolution. Areas at the terminus of unpaved South Florez Street appear to be disturbed. The orientation of the

stream/river associated with the Santa Ana River channel has changed and it trends close to the northern site boundary.

1968 Aerial Photograph – In the 1968 photograph, there is a circular-shaped area of darker soil at the northwest portion of the site that also extends off site to the north. Near the northern property boundary is a dumping area, lighter colored and what appears to be a truck actively dumping (the northern property boundary on the historical aerial photograph was slightly moved north to show this feature). The circular/elliptical shaped feature suggests dumping from the north creating a waste slope to the south-southeast and east. Vehicles are located north of the site, near the terminus of South Florez Street and may or may not be related to dumping or could be associated with residential properties.

1975 Aerial Photograph – This infrared photograph is poor resolution; however, the roughly circular areas shows lighter colored areas, likely related to dumped materials. The lateral extent of the dump appears to have expanded. Several dirt paths appear leading to and from the waste disposal area. As in the previous photograph, although not entirely clear, it appears that wastes extend off site to the north at locations of residential properties.

1985, 1989 Aerial Photographs – The 1985 and 1989 aerial photographs show evidence of dumping at the site. A looping dirt road extending from South Florez Street appears to be located on wastes appears at the central portion of the site. The road likely was used by trucks to access the dump area and circle back up to South Florez Street. Debris is visible on the slope areas of the waste disposal area.

1995 Aerial Photograph – In the 1995 aerial photograph, the looping dirt road assumed to be related to waste disposal is no longer present. Areas of what appear to be surficial wastes are visible at the south, southeastern and eastern portion of the site, likely related to dumping further north. Off site areas to the adjacent north of the site, near the terminus of South Florez Street (west and east sides) that are the future locations of residential properties; appear similar in appearance to the northern waste disposal area and could be related to grading of the site/offsite

areas. (Background information indicates the site was graded in 1995). Several dirt roads are visible around the site and within the project area.

2005, 2006, 2009, 2010, 2012, 2014 and 2016 Aerial Photographs – The 2005 through 2016 aerial photographs indicate the site generally similar to current conditions. Changes in the area are generally related to residential development to the north, some of which may be on portions of the waste disposal site. By 2005, the WDS area shows increased vegetation. Some areas of what appear to be surficial wastes are visible on the slopes of the waste disposal area. To the adjacent north and on the west side of South Florez Street are recently constructed residential properties. By 2005, a lumber company is located west of the site. By 2009, an additional residence has been constructed on the west side of South Florez Street, adjacent to the site and the paved road has been extended south. In 2010, a residence is being constructed on the west side of South Fernando Street at the terminus of the street. The residential lots on the east side of the terminus of South Florez Street remain undeveloped; however by 2012, the northern area appears to be graded. The 2016 aerial photograph indicates two recently constructed residential properties on the east side of South Florez Street, near the terminus. Stockpiles of debris that due to their locations appear to be related to the recent residential constructions are located to the east and south. During the site reconnaissance in 2016, the stockpiles appeared to consist of construction related debris such as bricks, concrete slabs, and cinder blocks (Appendix C).

Historical topographic maps from 1896 through 2012 showed the site as undeveloped land. Indications of landfill activities were not observed in the historical topographic maps. The Santa Ana River is shown to the east and south of the site. In the 1938 topographic map, the Riverside Canal (Aqueduct) is shown south-southeast of the site. In the 1954 topographic map, a recreational park and school are located north and west of the site, respectively. Also, three groundwater water wells are located south of the site and adjacent to the Santa Ana River. The Union Pacific Railroad tracks are present to the west of the site. Residential homes are visible along South Florez and South Fernando Streets. Area south of the site consisted of undeveloped vacant land.

8. PREVIOUS INVESTIGATIONS

This section summarizes available previous information related to the Guyaux WDS relevant to the subject Phase II ESA. In general, there was considerable information about the history of the waste disposal and the previous investigations indicated as early as 1989, the WDS was the location of potential environmental and human health and environmental issues.

Technical Memorandum No. 2B, Santa Ana Watershed Project Authority (SAWPA), Rapid Infiltration/Extraction (RIX) Demonstration Project, Site 2 Hydrogeological Investigation, SAWPA, December 21, 1989

In 1989, the SAWPA conducted a hydrogeological investigation of a 110-acre area (including the site) for a potential RIX facility. As part of the investigation, three groundwater monitoring/extraction wells were installed in the area of "Site 2" (also identified as the "Demo Site"), which included the site. Analytical results from the groundwater wells indicated concentrations of tetrachloroethylene (PCE) ranging from 7 to 17 micrograms per liter (µg/l) and arsenic up to 18 parts per billion. Based on this information and other factors, SAWPA abandoned Site 2 as a potential RIX facility.

Preliminary Assessment Report, Guyaux Landfill, (EPA ID No. CAD983652033), Weston, June 9, 1993

In 1993, Weston observed wood, concrete, asphalt, bricks, old tires, mattresses, household refuse, furniture, fragments of steel and metal, car and truck frames, empty drums, car fuel tanks, telephone poles, and a crushed fuel tank (approximately 500 gallons) on the property. Weston identified the approximately ten waste piles (totaling approximately 30,000 cubic yards [cy]) observed during the site reconnaissance from Griffin Wheel Company as a potential source of contamination for groundwater, surface water, soil exposure, and air pathways. Weston indicated the "site soil" was suspected to contain high levels of metals including arsenic, lead, chromium, cadmium, copper, and zinc. Waste material from the Crane Company was also observed throughout the site. The quantity and composition of the Crane Company waste was unknown. Weston indicated the Crane Company wastes were not evaluated since the contaminants from Griffin Wheel Company were perceived to be more hazardous to human health and the environment. The Weston report also indicated that the site stopped accepting wastes by 1985.

Memorandum, Guyaux Landfill (Located in City of Colton) – Background and Rationale for Not Taking Enforcement Action, RWQCB, February 22, 1995

In February 1995, the RWQCB issued a memorandum regarding potential enforcement action at the Guyaux landfill, which summarized activities related to the site from November 1994 to January 1995. Summary information included news articles published about the site, Mr. Guyaux receiving the title to the site in July 1994, and various meetings. The RWQCB determined that enforcement action would not be pursued at the site based on the following:

- According to the RIX study, the site "does not appear to be having a significant impact on groundwater." The PCE detected in the wells were consistent with other wells in the surrounding area, and some metals were "slightly" higher in the down-gradient RIX well versus the up-gradient well. Selenium had a "slight" exceedance of the Primary Drinking Water Standard, and the RWQCB concluded the elevated detection was potentially due to different sampling techniques since the down-gradient sample was not filtered.
- The site was well-graded and drains well.
- The site had not received wastes in over 12 years, and most of the wastes had been in place for more than 30 years. The RWQCB hypothesized that a significant VOC plume or metals would have shown up during the 1989 RIX sampling.
- Further groundwater investigation would not add much to the RIX investigation, other than future changes in groundwater quality at the RIX wells. However, the down-gradient well was previously backfilled with grout and abandoned.

Site Inspection, Guyaux Landfill, End of South Florez and South Fernando Streets, Colton, CA 92324, Bechtel, May 15, 1995

In May 1995, Bechtel was tasked by the EPA to perform a Site Inspection (SI) following the results of the 1993 Weston PA. The purpose of the SI was to further investigate the Guyaux Landfill by using existing information and using the EPA's Hazard Ranking System (HRS). The HRS assesses the relative threat associated with actual or potential releases of hazardous substances at the site. Bechtel noted piles of used tires, piles of waste slag, furniture, and 10 empty 55-gallon drums during their site reconnaissance. According to Bechtel, a Phase II site assessment was performed at the Griffin Wheel Company in 1989 by Dames and Moore to characterize the waste slag. A copy of the Dames and Moore report was not provided to Ninyo & Moore for review. According to Bechtel, results of 1989 laboratory analyses of the waste slag

samples indicated elevated levels of Title 22 Metals, including 105 milligrams per kilogram (mg/kg) of arsenic, 72.1 mg/kg of cadmium, and 9,520 mg/kg of lead (concentrations three times greater than background levels). Based on the SI, Bechtel identified that the waste slag, the arsenic concentrations detected in the down-gradient groundwater well during the RIX study, and presence of three drinking water systems (operating 49 municipal drinking water wells) within 4 miles of the site as HRS factors.

Expanded Site Inspection (ESI), Guyaux Landfill, End of South Florez and South Fernando Streets, Colton, California 92324, Bechtel, August 14, 1996

In August 1996, Bechtel performed an ESI after the EPA reviewed the 1995 Bechtel SI. At the time of their January 1995 site reconnaissance, the site was not fenced and was covered with vegetation; however, during the ESI, the "landfill portion" of the site was graded and the vegetation cleared.

As part of the ESI, Bechtel collected 25 "soil" samples at the site and three groundwater samples from nearby irrigation wells owned and operated by the City of Riverside. "Soil" and groundwater samples were analyzed for Title 22 Metals and VOCs. Soil analytical results indicated concentrations of arsenic (up to 39.9 mg/kg), cadmium (up to 25.2 mg/kg), chromium (up to 383 mg/kg), lead (up to 5,600 mg/kg), manganese (up to 16,500 mg/kg), mercury (up to 1.1 mg/kg), and toluene (up to 150 micrograms per kilogram [µg/kg]) at concentrations greater than three times background levels. For the groundwater analytical results, Title 22 Metals and VOCs were not detected in the down-gradient well at concentrations three times above those detected in the cross-gradient or up-gradient wells. During the March 1996 "field event," Bechtel noted the WDS had been graded and relatively flat. Bechtel identified "dark foundry slag" on the site, and two partially buried drums on the south and east portions of the site. The contents of the drums were not identified.

As a result of the ESI, Bechtel identified the Griffin Wheel Company waste slag on the site as an "apparent problem." Based on the results of the ESI, the EPA issued a letter to Mr. Guyaux in 1997, determining the site did not qualify for listing on the federal National Priorities List (Superfund). The EPA identified the potential of exposing the public to site contaminants and

referred the site to the Department of Toxic Substances Control (DTSC) as the lead agency for further investigation and remediation.

The EDR Radius Map Report with GeoCheck, South Colton Project California Environmental Quality Act (CEQA), Fogg Street/Congress Street, Santa Ana, California 92324, EDR, March 3, 2009

An EDR radius map report, dated March 3, 2009, was prepared as part of the South Colton Project California Environmental Quality Act (CEQA). The area of study for the radius report was a larger area in the Santa Ana River floodplain, which included the site. The site was listed as "Florez Street" on the United States Brownfields database. A Phase I ESA was conducted at the WDS in 2001, and the current owners were listed as Isela Gonzales and David Avina. According to the database, the site was formerly the "Guyuak" Landfill (including solid wastes) from the 1960s through the mid-1980s. The landfill closed in 1985 prior to state closure regulations being in effect." The site was also listed as Guyaux Landfill on the Comprehensive Environmental Response, Compensation, and Liability Information System – No Further Remedial Action Planned database. This database is for archives sites that to the best of the EPA's knowledge, assessment at a site has been completed and that the EPA has determined no further steps will be taken to list this site on the National Priorities List. The link in the radius map report to this listing had expired and was not accessible. Additional information was not provided in the radius map report.

Work Plan for Remediation of Lead-Impacted Soil, South Colton Site, Parcels 016336212, 016336226, and 016336227, Colton, California, Environmental Engineering and Contracting, Inc. (EEC), July 20, 2010

In 2010, EEC prepared a work plan to remediate lead-impacted soil at the WDS. According to EEC, the property owner (The Maturin Group) planned to raise the grade of the WDS out of the 100-year floodplain using engineered fill. EEC indicated that a Phase II ESA report, prepared by EastStar Environmental Group (EastStar) in 2009, estimated approximately 98,000 cy of waste material and soil were placed on the site. A copy of the 2009 EastStar report was not available to Ninyo & Moore for review.

EEC planned to excavate three locations to remove lead that exceeded the action level of 1,000 mg/kg identified in the 1996 Bechtel ESI. A letter from the RWQCB, dated July 23, 2010, approved the EEC work plan and requested a report detailing the removal activities upon completion of the cleanup project. The proposed scope of work in EEC's Work Plan was not implemented.

Letter, Final Environmental Impact Report (EIR) for Soil Safe Land Improvement Project, City of Colton, San Bernardino County, RWQCB, March 23, 2011

In 2011, the RWQCB approved a Final Environmental Impact Report (FEIR) for the Soil Safe Land Improvement Project, which proposed to grade and fill a 29-acre property with non-hazardous treated soils in order to raise the site's elevation above the Santa Ana River floodplain. The FEIR was not available to Ninyo & Moore for review. Although the precise location of the 29-acre property was not identified in the RWQCB letter, it is assumed that the property identified in the FEIR is the Guyaux Landfill.

Memorandum, Guyaux Landfill Update, City of Colton, Development Services Department, September 6, 2012

In September 2012, the City of Colton Development Services Department (City) issued a memorandum to the mayor and council members summarizing research the City performed on the Guyaux Landfill. According to the City, Mr. Mike Griffin was identified as a former property owner willing to cooperate on clean-up activities, however the site was in receivership and the bank and other creditors were not currently willing to clean up or sell the property. After discussing the site with environmental engineers and the RWQCB, the City determined there was minimal health risk to nearby residents from exposure to the former landfill, but there was a possibility of long-term impacts on groundwater from continued leaching of rain/runoff through the landfill. A soil study conducted at the site (Bechtel, 1996) found lead exceeding federal standards at several "hot spots." Soil Safe tested soil and installed five groundwater monitoring wells at the site in 2010. According to the City, the 2010 investigation "did not find lead levels that meet hazardous thresholds" in soil, and trace volatile organic compounds (VOCs) were detected in groundwater, "but not at hazardous levels, and no discernable impacts on groundwater." The RWQCB recommended the City review historical information on the site,

investigate the "hot spots", design and install drainage improvements to move runoff around the landfill, and cover the landfill with topsoil or other cover.

9. TOPOGRAPHY, GEOLOGY, AND GROUNDWATER

The following sections provide general information on the topography geology and hydrogeology at the site and vicinity based on review of available maps and other publications, previous environmental investigation reports and these field observations during this investigation.

9.1. Topography

Based on review of the United States Geological Survey (USGS), 7.5-Minute Topographic Quadrangle Map Series, San Bernardino South, California, 1967 (revised 1980), the site is located in Township 1 South, Range 4 West, of the San Bernardino Base and Meridian. According to a recent land survey conducted by PBLA Engineering (Appendix B), the upper area of the WDS is at an elevation of approximately 929 to 933 feet above MSL to approximately 915 to 920 feet MSL at the base of the slopes. The surface runoff flow direction is towards the southwest based on topography.

9.2. Geology

Based on a review of the USGS Geologic Map of the San Bernardino South 15' Quadrangle, San Bernardino, County (USGS, 1966), the site is mapped as young alluvial fan deposits of late Holocene age, consisting of coarse sand to boulder alluvium of modern fan deposits (USGS, 2006). Based on the 13 trench excavations that extended below wastes, underlying formation consists of alluvium generally described as consisting of light brown, moist, loose sand to the maximum depth excavated, approximately 22 feet bgs. More detailed information is included on the individual trench logs (Appendix F, and Figures 6 and 7).

9.3. Groundwater

This site is located in the Upper Santa Ana Valley Groundwater Basin near the boundary of the Rialto-Colton, Bunker Hill and San Timoteo Groundwater Subbasins of the Upper Santa Ana River Hydrologic Area (California Department of Water Resources [DWR], 2006).

Based on information included in the DWR, the subbasins consist of alluvial materials that underlie the San Bernardino Valley. The aquifers of the Upper Santa Ana Valley Groundwater Basin are generally unconfined and comprise several subbasins filled with alluvial deposits eroded from the surrounding mountains. The thickness of these deposits ranges from less than 200 feet to more than 1,000 feet. Faults play an important role in the groundwater flow system. Approximately 0.5 miles to the east of the site, the San Jacinto Fault divides the Upper Santa Ana Valley Groundwater Basin into its subbasins. The San Jacinto Fault acts as a barrier to the westward movement of groundwater in the older alluvium but does not affect groundwater movement in the unfaulted, younger alluvium and river channel deposits (DWR, 2006).

According to an ESI document by Bechtel, a 1989 hydrogeological study conducted by the SAWPA in the site vicinity indicated a perched groundwater table from approximately 40 to 80 feet bgs (Bechtel, 1996). Additionally, a work plan for lead remediation of several isolated areas of the WDS prepared by EEC (EEC, 2010), indicates four groundwater monitoring wells were installed in the vicinity of the site in 2009. The depth to groundwater in these wells at that time was reported to range from approximately 85 to 94 feet bgs. During Ninyo & Moore's site reconnaissance conducted on April 26, 2016, the depth to groundwater measured in a well located at the base of the southern limits of the landfill was approximately 92.5 feet bgs (Figure 3). Groundwater was not encountered in the trench excavations during the Phase II ESA.

10. SCOPE OF WORK

The scope of work for this Phase II ESA was based on the project objectives indicated in the approved work plan which were to characterize and delineate the lateral and vertical extent of wastes, evaluate the potential presence of cover and provide an estimated volume of wastes within the Project boundary so that the City can assess whether covering or capping the WDS would be an effective and appropriate remedial action consistent with the planned Project. The following scope of work was performed:

- Re-reviewed and evaluated historical aerial photographs of the WDS and vicinity to obtain information pertaining to the suspected locations and lateral extent of the wastes and years wastes were disposed of at the site. Re-reviewed background information/reports pertaining to the types and locations of wastes.

- Prepared a Site Health and Safety Plan (SHSP) that was implemented during fieldwork. The SHSP addressed worker safety associated with planned field activities and included the requirement to conduct air monitoring. The LEA and/or CalRecycle did not request a Community Health and Safety Plan (CHSP) for the Phase II ESA. Air/dust monitoring was conducted at the active excavation area and at the perimeter of the site (upwind and downwind) to document that field activities did not create excessive fugitive dust.

- Provided notifications to Ms. Diana Almond (LEA) and Dawn Plantz (CalRecycle), several weeks prior to beginning fieldwork.

- Notified Underground Service Alert (USA), a public utility locator, of the proposed trench locations approximately one week prior to field activities so that they could contact representatives of utility companies in the area to identify potential subsurface utilities.

- Arranged for and oversaw the geophysical survey conducted prior to and concurrent with the site investigation to assist with locating the limits of the wastes.

- Retained a licensed, qualified, and experienced backhoe contractor to provide equipment and a 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) trained operator to excavate/backfill 22 exploratory trenches (T-1 through T-22), and a 40-hour HAZWOPER trained technician to help direct excavation and provide dust control, when required.

- Conducted a Phase II ESA kick-off meeting at the WDS prior to beginning the trenching and sampling activities and briefed the backhoe operator and assistant regarding planned activities and the responsibilities of each participant.

- Provided a California-registered Professional Geologist and/or geologist working directly under the registered professional, experienced in such investigations to direct, observe, collect samples and document field activities. The field personnel observed exploratory trench excavations and spoils, and documented observations and sample locations with photographs and on individual trench logs. They recorded the depths/locations, types, and estimated percentages of wastes, based on field observations, and graphically presented this information on individual trench logs.

- Arranged for and oversaw daily pick up of the samples in the field by Enthalpy Analytical, Inc. (Enthalpy) to their contracted state-certified laboratory for analytical testing. Soil and waste samples were analyzed for Constituents of Potential Concern (COPCs) as generally

indicated in the work plan (Ninyo & Moore, 2016) and typically present based on the suspected waste types.

- Backfilled each exploratory trench excavation in the approximate reverse order it was excavated. Identified the trench locations on field maps and with labeled wooden stakes for later reference.

- Performed dust and air monitoring in general accordance with the SHSP and as typically conducted when implementing a CHSP.

- Performed data review and validation including analysis of analytical data for precision, accuracy, and consistency.

- Prepared this Phase II ESA report that summarizes field activities, presents analytical results, includes figures depicting the findings, including the lateral and vertical extent of wastes, and provides conclusions and recommendations pertaining to environmental conditions at the site. The report also summarizes available background data, historical aerial photographs and topographic maps, the geophysical survey report, trench logs and photographs, and laboratory analytical reports.

11. DEVIATIONS FROM THE WORK PLAN

This Phase II ESA was conducted in general accordance with the LEA-approved work plan (Ninyo & Moore, 2016), with the following exceptions described in this section. Any modifications to the trench excavating plan or analytical testing did not compromise the project objectives; rather, they resulted in obtaining additional information about the WDS. The following activities differed from those that were proposed to be conducted as indicated in the work plan.

- As indicated in the work plan, some trench locations were modified in the field to take into account information obtained while conducting the investigation, such as field observations and conditions for the purpose of best delineating the wastes. Sampling was based on field observations of each trench. Authoritative protocol was used to allow the field personnel the flexibility to move, add or delete sampling locations, as necessary, and to accommodate unforeseen field conditions.

- The work plan indicated that a CHSP would be prepared to protect the public and surrounding land uses from potential health hazards during the investigation. Such a plan was not requested by the LEA or any other regulatory agencies. During the Phase II ESA, dust and air monitoring was conducted to document areas outlying the WDS were not impacted by the field work; and, dust was controlled by spraying active excavations and stockpiles with water.

- Depth of waste was not evaluated in all trenches due to excavation refusal on large pieces of debris and caving of the excavation sidewalls due to loose fill soils and presence of large pieces of waste debris, particularly asphalt and concrete slabs/footings. During the Phase II ESA, CalRecycle was in the field and was informed of this proposed deviation. It was agreed that at least one and preferably two to three trenches, if possible be excavated to the total waste depth and into the underlying alluvium. A total of 13 trenches were excavated to the total waste depth and into the underlying alluvium, an adequate number to generally delineate the lateral extent of wastes.

- Inadvertently samples were only analyzed for Total Petroleum Hydrocarbons (TPH) as diesel by EPA Method 8015M and not the full carbon chain speciation. It is our opinion that the limited TPH analytical testing does not adversely impact the Phase II ESA since the major concern with respect to COPCs at the WDS are metal concentrations of the wastes.

12. PHASE II INVESTIGATION

The Phase II ESA was conducted on March 21 to 23, 2017, by a California registered professional geologist and/or senior staff geologist working directly under the registered professional, both experienced in conducting such investigations.

12.1. Permits and Notifications

Permits were not required for the trench excavating, sampling, and backfilling activities. The City, CalRecycle and LEA staff were notified several weeks prior to the planned Phase II ESA activities.

12.2. Site Safety

Ninyo & Moore prepared a SHSP that identified the potential chemical and physical hazards that may be encountered during field activities at the site. The plan provided guidelines for use of personal protective equipment based on site-specific conditions, location and directions to the nearest hospital, and contingency plans. The plan was prepared in general accordance with Federal Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response Standard (29 Code of Federal Regulations 1910.120) and Title 8 CCR Section 5192. The plan was reviewed and approved by a certified industrial hygienist.

The SHSP was used daily during field activities, and WDS workers prior to beginning work on the first day reviewed and signed copies of the employee acknowledgment and field health and safety meeting forms included in the plan. In addition, prior to beginning fieldwork at the WDS each day, Ninyo & Moore field staff conducted brief, daily tailgate meetings and discussed the planned scope of work for the day and the key features of the SHSP. The meeting was attended by Ninyo and Moore, Innovative Construction Solutions, Inc. ([ICS], excavator and water truck subcontractor) staff, and Southwest Geophysics, Inc. (Southwest Geophysics). CalRecycle and LEA staff was briefed about the WDS conditions and potential SHSP issues when they arrived at the WDS. No health and safety related emergencies arose during fieldwork.

12.3. Community Health and Safety

A CHSP was not required by the regulatory agencies for the Phase II ESA performed at the WDS. Monitoring for dust was conducted at the active excavation area and at the perimeter of the site (upwind and downwind).

12.4. Subsurface Utility Clearance

Although subsurface utilities were not suspected in the area since the WDS within the Project Boundary is on undeveloped vacant land, Ninyo & Moore contacted USA, a public utility locator, a minimum of 48 hours in advance of the fieldwork, as required by law. USA, contacted utility companies that may have potential underground utilities or structures in the area. As applicable, utility owners of record or their designated agents clearly marked the locations of their utilities on the ground surface in and outlying the area designated for investigation.

12.5. Geophysical Survey

On March 21 and 22, 2017, Southwest Geophysics conducted a geophysical survey concurrent with conducting the Phase II ESA. Ninyo & Moore overlaid the anomalies on a topographic map which is provided on Figure 5. The purpose of the geophysical survey was to evaluate subsurface anomalies that may be present at the site and to evaluate the locations and lateral extent of the WDS. The geophysical survey was conducted using a Geometrics

magnetometer (MAG) and Geonics EM31 terrain conductivity meter to identify and delineate, as possible, the presence of buried debris including "foundry wastes" at the WDS. In order to facilitate the collection of magnetic and electromagnetic data, a Trimble Pro XRS global positioning system (GPS) was used for spatial control.

Traverses spaced approximately 10-15 feet apart were conducted across accessible portions of the survey area, with data points collected at 0.5 second intervals. Notable surface features such as chain-link fencing, surface debris, power poles, and other surface objects were mapped with GPS. The geophysical and GPS data were downloaded to a laptop computer in the field for preliminary analysis, and later compiled and further evaluated in the office.

Based on the geophysical report, the survey identified large changes in the magnetic field across the WDS and extending toward the base of the WDS. Numerous small magnetic anomalies were also detected down on the flood plain south of the perimeter of the WDS; however, these smaller anomalies were reported as likely related to surface and near surface debris. In general, both the MAG and the EM31 results indicated the presence of geophysical anomalous conditions across the majority of the WDS and correlating well with the lateral extent of the WDS to the east, south and west (base of the waste slope). In general, the geophysical survey indicated the presence of anomalous conditions in the area of waste disposal and the results of the geophysical survey correlated well with the extent of the wastes as delineated during this investigation.

A copy of the geophysical survey report is provided as Appendix D. The results of the geophysical survey are provided on Figure 5 to indicate the relationship between the geophysical anomalies, trench locations, and estimated extent of wastes.

12.6. Dust Control and Environmental Monitoring

During the Phase II ESA, mitigation measures were implemented that controlled air pollution and dust, and included suppression by spraying active work areas and temporary

stockpiled wastes as required, and minimizing the waste drop height from the excavator's bucket onto the temporary stockpiles.

During field activities, Ninyo & Moore conducted personal air monitoring to document that workers in the immediate vicinity of the excavation activities were not exposed to concentrations of COPC exceeding the action levels indicated in the SHSP. Air monitoring included measuring the breathing zone for concentrations of VOCs using a photoionization detector (PID) and for methane, hydrogen sulfide, carbon monoxide and oxygen using a four-gas meter. The air monitoring measurements did not exceed action levels indicating site workers were not exposed to COPCs (Appendix E).

Although a CHSP was not required for this investigation, dust monitoring was conducted using three Thermo DataRAM particulate monitor (pDRs) to monitor the particulate levels at the active excavation area and at the perimeter of the site (upwind and downwind). The pDRs continuously monitored and recorded the real-time concentration and median particle size of airborne dust, smoke, mist, and fumes. Ninyo & Moore staff monitored the pDRs during excavation and backfilling activities.

If during trench excavating and backfilling activities, visible fugitive dust was observed, then dust suppression was implemented consisting of applying water to the active excavation area and temporary stockpile. The active work area and perimeter air monitoring measurements (field instrument readings) indicated that readings were significantly lower than the typical action level of 1.0 milligrams/cubic meter (mg/m^3) and, therefore, had not resulted in exposure to workers or the community. Implementing the perimeter dust monitoring documented that the public and surrounding properties were protected from potential health and environmental hazards and that community exposure to adverse conditions did not occur during the Phase II ESA activities (Appendix E).

12.7. Trench Excavation

From March 21 to 23, 2017, 22 exploratory trenches were excavated within or at the boundaries of the WDS, 21 were located within the Project boundary and one was located on

the vacant land parcel to the adjacent north of the WDS (Figure 3). A California OSHA 40-hour trained operator excavated subsurface materials at each trench location. Trench excavating was accomplished using a track hoe excavator. As possible, each excavation was to a depth adequate to evaluate the depth of wastes and into the underlying alluvium, and/or to the maximum depth that could be excavated based on extensive caving of the excavations, and/or to a depth adequate to confirm the absence of waste (e.g., in the case of suspected surface or shallow wastes). If wastes, were observed, the excavation continued, as possible until the contact between the base of the wastes with the underlying alluvium was encountered. At locations where only surface or shallow wastes were encountered, the trench was excavated to a depth sufficient to document this suspected condition. Excavations remained open long enough to log the trench, collect samples, and document the trench and excavated materials on individual trench logs and with photographs. Because only one trench was excavated at a time, each trench was immediately backfilled.

The excavated materials were temporarily placed a sufficient distance from the excavation, typically greater than 2 to 5 feet, to prevent them from falling back into the excavated trench. During excavation, if wastes were encountered, they were segregated from excavated cover fill soil (if present) and the underlying alluvium, by separately stockpiling the excavated materials. Dust control was implemented because the excavated materials were typically dry and generated dust and typically there were light winds in the afternoon that could potentially cause dust to migrate particularly at locations where trenches were located close to the Project boundary.

Trench length, width, and depths depended on specific conditions at the location excavated, including depth of the wastes and waste materials. Specific information pertaining to trench locations, orientations, length, depths, sampling locations and presence of wastes are provided on the individual trench logs, and corresponding photographs (Appendix F).

12.8. Trench Locations and Rationale

The exploratory trench locations were selected based on available historical aerial photographs indicating suspected locations of wastes, results of previous and environmental

investigations, the geophysical survey (Southwest Geophysics, 2017) and information obtained while conducting the Phase II ESA.

Figure 3 presents the exploratory trench locations, orientations and lengths. Figure 4 shows the exploratory trench locations and WDS overlain onto the recent topographic map. As mentioned, trench locations were typically modified in the field to take into account information obtained while conducting the investigation, such as field observations and conditions encountered during sampling and to take into account geophysical survey findings. Authoritative protocol was used to allow the field personnel the flexibility to move, add or delete sampling locations, as necessary, and to accommodate unforeseen field conditions and to make real-time decisions to best delineate the wastes.

The following table summarizes the locations and rationale of the exploratory trenches, whether wastes were present, and approximate depths and thicknesses.

Table 1 – Summary of Trench Excavations and Waste Thicknesses

Test Pit/ Trench ID	Waste Depths (feet bgs) and Thickness (feet)	Location	Rationale/Comments
T-1	0-~8+ (~8+)	Southwest of the terminus of South Florez Street	Location chosen due to the presence and amount of metal slag, metal disk molds and darkly colored (metallic?) soils observed on the surface
T-2	0-~7+ (~7+)	Offsite on vacant parcel, adjacent and immediately east of South Florez Street, adjacent and immediately south of residential property under construction	Evaluate the northern lateral extent of wastes, confirm that as suspected, wastes extend north of the Project boundary and likely beyond the vacant parcel onto the two residential properties under construction
T-3	0-~13+ (~13+)	Northeastern site boundary, south of residential property, west of South Fernando Street	Evaluate the northeastern extent of wastes at the Project boundary adjacent to a residential property, evaluate whether wastes likely extend offsite, evaluate waste depth, as possible
T-4	0-~11 (~11)	~130 feet southeast of South Fernando Street	Evaluate the suspected lateral (and vertical) eastern extent of wastes
T-5	0-~1.5 (~1.5)	Northeastern site boundary, adjacent and immediately southeast of South Fernando Street	Evaluate the potential presence of wastes in an area of what appeared to be recent surface dumping along a dirt foot path/trail

Table 1 – Summary of Trench Excavations and Waste Thicknesses

Test Pit/ Trench ID	Waste Depths (feet bgs) and Thickness (feet)	Location	Rationale/Comments
T-6	Surface	Northeast of WDS, immediately south of vacant lot, and east of South Fernando Street	Evaluate the potential presence of wastes in an area of what appeared to be recent surface dumping
T-7	0-~2 (~2)	Suspected eastern extent of waste disposal	Evaluate the suspected lateral(and vertical) eastern extent of wastes
T-8	0-~8.5 (~8.5)	Suspected southeastern extent of waste disposal	Evaluate the suspected lateral (and vertical) eastern extent of wastes in an area of extensive surficial metal disks, metal slag and darkly colored (metallic?) soils
T-9	0-~10.5 (~10.5)	Suspected southeastern extent of waste disposal, northwest of dirt road	Evaluate the suspected lateral (and vertical) southern extent of wastes
T-10	0-~8 (~8)	Suspected south-southwestern extent of waste disposal, north of unpaved dirt road and west of monitoring well	Evaluate the suspected lateral (and vertical) southern extent of wastes
T-11	0-~7 (~7)	Suspected southwest extent of waste disposal, just east of SS-10 and northeast of dirt road	Evaluate the suspected lateral (and vertical) southwestern extent of wastes in an area of metallic waste debris and dark colored (metallic?) soils
T-12	0-~19 (~19)	Suspected west-southwestern extent of wastes, 35 feet east of Project boundary	Evaluate the suspected lateral (and vertical) west-southwestern extent of wastes adjacent to the Largo Concrete Inc., facility, assist with evaluating whether wastes likely extend offsite to the west (beyond the Project boundary)
T-13	0-~16.5 (~16.5)	Northern site boundary, adjacent and immediately southwest of residential property, 120 feet west of Fernando Street, adjacent and immediately east of northern residential property under construction, east of South Florez Street	Evaluate the vertical extent of wastes (T-3 and T-19 experienced severe caving and total waste depth could not be obtained) and adjacent to residential properties to evaluate the likelihood that wastes extend to offsite residences to the north of the Project boundary
T-14	0-~15+ (~15)	Suspected central WDS area	Evaluate the vertical extent of waste
T-15	0-~18 (~18)	South central waste disposal site area, in the area of previous Bechtel (1996) samples SS-21 and SS-28	Evaluate the vertical extent of wastes
T-16	0-~8 (~8)	Westernmost Project boundary, adjacent to the Largo Concrete, Inc., facility.	Evaluate the western lateral (and vertical) extent of wastes and whether wastes likely extend offsite and onto the Largo Concrete, Inc., facility.

Table 1 – Summary of Trench Excavations and Waste Thicknesses

Test Pit/ Trench ID	Waste Depths (feet bgs) and Thickness (feet)	Location	Rationale/Comments
T-17	0-~8+ (~8+)	Northern site boundary, adjacent and immediately south of residential property, 75 feet west of South Florez Street	Evaluate the northern lateral (and vertical) extent of wastes and whether wastes likely extend offsite and onto the adjacent residential property
T-18	0-~10+ (~10+)	Northern site boundary, adjacent and immediately south of South Florez Street	Evaluate the northern lateral (and vertical) extent of wastes and whether wastes likely extend offsite onto the residential community to the adjacent north
T-19	0-~10+ (~10+)	Northern site boundary, east of vacant lot, east of South Florez Street, adjacent to construction debris pile	Evaluate lateral and vertical extent of wastes and whether the wastes likely extend offsite to the west onto the vacant lot/residential properties undergoing construction
T-20	0-~10+ (~10+)	~90 feet southwest of South Fernando Street and east of construction debris pile	Evaluate the vertical extent of waste
T-21	0-~8.5+ (~8.5+)	110 feet west of the suspected easternmost limits of waste disposal	Evaluate the vertical extent of waste
T-22	0-~12.5 (~12.5)	South central waste disposal area, between previous Bechtel (1996) samples SS-22 and SS-27	Evaluate the vertical extent of wastes

Notes:
bgs – below ground surface
Depths and thicknesses are approximate

12.9. Sampling Methodologies

Samples were collected by Ninyo & Moore field personnel and sample locations and depths were selected based on subsurface conditions encountered at each trench location. One to four samples were collected at each trench; the number of samples was based on field observations with the most samples collected at locations where the thickest amount of wastes was observed. At each trench location, a sample was collected from the surface, within the wastes, and if encountered, in the underlying alluvium. The number of samples, depths and locations were based on visual observations of subsurface materials. Representative surface and relatively shallow samples were collected by directly coring the laboratory-supplied jar into the trench excavation surface, floor or sidewall. Deeper samples were obtained by coring the laboratory-supplied glass jar into materials contained within the

excavator bucket. Only discrete samples were collected. Sample locations were measured and recorded on individual trench logs (Appendix F). Field screening instruments (e.g., PID and four-gas meter) monitoring data was not useful in selecting sample locations/depths since elevated readings were not recorded.

12.10. Background Soil Sampling

Three background soil samples (BKG1 through BKG3) were collected by directly coring the laboratory-supplied jar into the surface where native material is present south of the WDS. Each background sample was labeled with a unique sample identifier (e.g., BKG1-0.5) denoting the sample was collected from near surface. Individual sample jars were padded with a cushioned sleeve and were then placed into zip-lock plastic bags. Background samples were submitted to Enthalpy, a California-certified analytical laboratory based in Orange, California for Title 22 metals analyses. The background sample locations are shown on Figure 3 and the Title 22 metal results are summarized on Table 3.

12.11. Sample Handling

Ninyo & Moore field personnel immediately labeled each sample jar to ensure proper identification for tracking by the analytical testing laboratory. Each sample jar was labeled with trench identification number, sample depth, date, and time the sample was collected, and project location and number. Individual sample jars were padded with a cushioned sleeve and were then placed into zip-lock plastic bags. Samples were placed into coolers containing ice and each day the coolers were picked up by courier service provided Enthalpy, a State of California certified, fixed-base analytical testing laboratory. The chain-of-custody (COC) forms were completed for each sample at the time of collection and were maintained through sample delivery to the analytical testing laboratory. COC documentation recorded the description, possession, condition, and transfer of samples.

12.12. Field Documentation

The information recorded on the trench logs generally included the following:

- Project name, number, and trench identification number.

- Trench location information, orientation and length.
- Schematic diagram of the trench excavation indicating trench orientation, length and total depth excavated; estimated depths to strata changes, approximate locations and depths of wastes as applicable; and sample locations, as applicable.
- Unique sample identifier (e.g., *T-22-15*) denoting the sample was collected from exploratory trench T-22 at a depth of approximately 15 feet bgs.
- Type of excavating equipment.
- Date trench was excavated/backfilled.
- Name of person(s) logging the trench.
- Descriptions/interpretations and visual classification of subsurface materials encountered were recorded on individual trench logs, and included:
    - General descriptions of wastes, including an estimate based solely on visual observations of the approximate estimated percentage of wastes relative to fill soils and primary constituents comprising the wastes (e.g., metal wastes or debris, construction wastes/debris, concrete, asphalt etc.).
    - General lithologic descriptions of native materials/geologic formations (alluvium) based solely on visual observations.

At the completion of each exploratory trench, the trench identification number, location, and general orientation were identified on the field map. Trench excavations were temporarily re-staked for future reference.

Photographs were taken to document trench excavation, sample locations, and backfilling activities and included the trench excavation and stockpiled materials. The photographs documented and supplemented information recorded on the individual trench logs (Appendix F).

A general chronological description or summary of the field work being conducted was recorded on Daily Field Reports and air and dust monitoring readings were recorded on forms (Appendix E).

13. WASTE DISPOSAL AREA AND EXTENT OF WASTES

Waste debris was observed in trenches T-1 through T-22 at depths ranging from the surface to approximately 19 feet bgs. Generally, two types of wastes were observed, metal wastes and construction wastes. Metal wastes were observed to generally consist of metal disks, metal slag and other metal debris and darkly colored (metallic?) soils, likely associated with wastes generated by the Griffin Wheel Company. Construction wastes were observed to generally consist of concrete, brick, insulations, tile, wood, porcelain (toilet), and asphalt debris, likely associated with City of Compton flood damage. In addition, plaster molds were observed, likely related to waste disposal associated with the Crane Company. The maximum waste depth of approximately 19 feet bgs was observed in trench T-12 located at the southwest portion of the WDS. A 55-gallon steel drum was encountered at a depth of approximately 4 feet in trench T-11. The drum contained soil, was damaged and crushed on one side. Additionally, fragments of a dry, car battery were encountered at a depth of approximately 2.5 feet in trench T-21. The extent of the wastes encountered during the trench investigation correlated well with the results of the geophysical survey (Figure 5).

Based on wastes observed in trenches located at the Project boundaries, and the one trench on the vacant lot to the adjacent north, field observations and information provided by residences in the area, it appears that wastes extend beyond the Project. More specifically, based on waste thicknesses at trenches located at the Project boundaries with residential properties, wastes likely extend offsite and to the north onto residence(s) west of South Fernando Street and to residences both west and east of South Florez Street. Wastes were observed in the trench excavation on the vacant lot to the north of the Project boundary. To the adjacent north of the vacant lot, two residential properties are currently undergoing construction. Based on conversation with a representative of the two properties under construction, the construction debris stockpile located to the adjacent east was generated during excavation of footings down to approximately 4 feet bgs, indicating wastes extend to these properties. In addition, a nearby resident indicated that debris extended at least to the location of the water pump station approximately two houses north of the Project boundary, on the east side of South Florez Street. Based on trenches at the western

Project area, wastes likely also extend offsite to the west, onto an industrial property (Largo Concrete, Inc.).

The lateral extent of the wastes was delineated to the west, south and southwest and generally corresponded to the assumed extend on the 1995 historical aerial photograph and the geophysical survey (Figures 3 and 5). Trenches T-4 through T-13, T-15, T-16, and T-22, the wastes were vertically delineated. Deeper trenches with greater amounts of waste debris became unstable with depth, trench walls continuously collapsed, causing the trenches to become wider and unsafe to continue exploration, and some trenches encountered refusal on large pieces of waste debris. Therefore, trenches T-1 through T-3, T-14, and T-17 through T-21 were discontinued at their respective total depths and wastes were not vertically delineated as agreed with CalRecycle staff.

14. ANALYTICAL TESTING

The primary objective of this project was to characterize and delineate the wastes at the site, to determine the concentrations in the samples, and to evaluate whether the WDS can be capped/covered based on the proposed future site use as a soccer complex and community park.

The analytical testing program for samples collected while trenching was based on available history of the WDS. Samples were analyzed by Enthalpy, a California-certified analytical laboratory located in Orange, California (Appendix G). Table 2 summarizes the COPCs, test methods and number of samples analyzed.

Table 2 – Analytical Testing – Soil and Waste Samples

Constituents of Potential Concern (COPC)	EPA Method	Number of Samples
Title 22 Metals (TTLC)	6010B/7471A	65
Semi-Volatile Organic Compounds (SVOCs)	8270C	13
Volatile Organic Compounds (VOCs)	8260B	14
Organochlorine Pesticides (OCPs)	8081A	5
Polychlorinated Biphenyl (PCBs)	8082A	6
Total Petroleum Hydrocarbons (TPH-diesel)	8015B (M)	4

Notes:
TTLC – Total Threshold Limit Concentration
M – Modified

TPH, PCBs, VOCs, semi-volatile organic compounds (SVOCs), and organochlorine pesticides (OCPs). In addition, samples representing alluvium underlying the wastes were tested for the COPCs, primarily to evaluate whether wastes have impacted the underlying soils.

15.1. Background Sample Results

- Arsenic concentrations in the three background samples were similar and ranged from 3.27 to 3.71 mg/kg. These concentrations exceed the residential and industrial RSL of 0.68 and 3.0 mg/kg, respectively, as well as the DTSC HERO residential and industrial screening levels of 0.11 and 0.36 mg/kg, respectively. The background arsenic concentrations in the three samples were higher than the residential and industrial RSLs and DTSC HERO screening levels. The DTSC has determined that 12 mg/kg is a useful screening level as a background concentration in Southern California soils for evaluating arsenic as a COPC.

- Lead concentrations in the background samples were detected at 13.0, 23.1, and 55.3 mg/kg. These lead concentrations are less than the residential and industrial RSL of 400 and 800 mg/kg, respectively, as well as less than the DTSC HERO residential and industrial screening levels of 80 and 320 mg/kg, respectively. One background sample, contained lead at a concentration that exceeds 10 times the Soluble Threshold Limit Concentrations (STLC) lead value (50 mg/kg), classifying this material as potentially hazardous for lead.

- Thallium concentrations were not detected in the samples above the reporting limit.

15.2. Grab (Surface Waste) Samples

Two grab samples of the waste debris were collected from the ground surface in the area of trench T-1 to evaluate the types of metals and concentrations in two different types of metallic waste debris. Grab sample GS-1 consisted of a metal disk and grab sample GS-2 consisted of vesicular metal slag; both of which based on available background information, likely originated from the Griffin Wheel Company. Arsenic was detected in the metal disk sample at a concentration of 5.01 mg/kg. Arsenic was not detected in the grab sample of the vesicular slag.

- Arsenic concentration was detected in one grab sample (GS-1) at 5.01 mg/kg. This concentration exceeds the residential and industrial RSLs of 0.68 and 3.0 mg/kg, respectively, as well as the DTSC HERO residential and industrial screening levels of 0.11 and 0.36 mg/kg, respectively. This concentration did not exceed the DTSC background concentration of 12 mg/kg used for soil screening on school sites.

15. ANALYTICAL RESULTS

This report section summarizes analytical results of samples analyzed and compares concentrations to the following regulatory screening and hazardous waste criteria:

- DTSC, Human and Ecological Risk Office (HERO), Human Health Risk Assessment, Note Number: 3, Cancer Value, DTSC-modified Screening Levels, June, 2016
- DTSC, Determination of a Southern California Regional Background Arsenic Concentration in Soil, G. Chernoff, W. Bosan and D. Oudiz, March, 2008
- EPA Region 9 Regional Screening Levels (RSLs) Screening Levels for Chemical Contaminants, Residential and Industrial Soil, updated May 2016 (http://www.epa.gov/region9/superfund/prg)
- California Code of Regulations (CCR) Title 22, Hazardous Waste Criteria, https://www.dtsc.ca.gov/LawsRegsPolicies/Title22/

Background soil samples (BKG1 through BKG3) were collected to evaluate background metal concentrations in soils/alluvium outlying the wastes (Figure 3). The three samples were analyzed for Title 22 metals to compare background metal concentrations with concentrations in the wastes, and although only limited background samples were analyzed generally establish background concentration in the alluvium, outlying the wastes.

Table 3 summarizes the metal analytical results and compares the data to screening levels and hazardous waste criteria. Tables 4 and 5 summarize TPH and polychlorinated biphenyls (PCB) analytical results for those samples with detected concentrations. Figure 8 summarizes arsenic, lead and thallium concentrations since these metals were detected at the highest concentrations and commonly exceed screening levels /or hazardous waste criteria.

Analytical results of samples were compared to applicable screening levels and hazardous waste criteria as discussed below. Analytical reports are included as Appendix G.

The analytical testing program for soil and waste samples was based on the history of waste disposal/types of wastes observed. The majority of samples were analyzed for Title 22 metals. Samples suspected of containing the highest metal concentrations were additionally analyzed for

TPH, PCBs, VOCs, semi-volatile organic compounds (SVOCs), and organochlorine pesticides (OCPs). In addition, samples representing alluvium underlying the wastes were tested for the COPCs, primarily to evaluate whether wastes have impacted the underlying soils.

15.1. Background Sample Results

- Arsenic concentrations in the three background samples were similar and ranged from 3.27 to 3.71 mg/kg. These concentrations exceed the residential and industrial RSL of 0.68 and 3.0 mg/kg, respectively, as well as the DTSC HERO residential and industrial screening levels of 0.11 and 0.36 mg/kg, respectively. The background arsenic concentrations in the three samples were higher than the residential and industrial RSLs and DTSC HERO screening levels. The DTSC has determined that 12 mg/kg is a useful screening level as a background concentration in Southern California soils for evaluating arsenic as a COPC.

- Lead concentrations in the background samples were detected at 13.0, 23.1, and 55.3 mg/kg. These lead concentrations are less than the residential and industrial RSL of 400 and 800 mg/kg, respectively, as well as less than the DTSC HERO residential and industrial screening levels of 80 and 320 mg/kg, respectively. One background sample, contained lead at a concentration that exceeds 10 times the Soluble Threshold Limit Concentrations (STLC) lead value (50 mg/kg), classifying this material as potentially hazardous for lead.

- Thallium concentrations were not detected in the samples above the reporting limit.

15.2. Grab (Surface Waste) Samples

Two grab samples of the waste debris were collected from the ground surface in the area of trench T-1 to evaluate the types of metals and concentrations in two different types of metallic waste debris. Grab sample GS-1 consisted of a metal disk and grab sample GS-2 consisted of vesicular metal slag; both of which based on available background information, likely originated from the Griffin Wheel Company. Arsenic was detected in the metal disk sample at a concentration of 5.01 mg/kg. Arsenic was not detected in the grab sample of the vesicular slag.

- Arsenic concentration was detected in one grab sample (GS-1) at 5.01 mg/kg. This concentration exceeds the residential and industrial RSLs of 0.68 and 3.0 mg/kg, respectively, as well as the DTSC HERO residential and industrial screening levels of 0.11 and 0.36 mg/kg, respectively. This concentration did not exceed the DTSC background concentration of 12 mg/kg used for soil screening on school sites.

- Chromium was detected in grab samples GS-1 and GS-2 at concentrations of 93.6 and 761 mg/kg, respectively. These chromium concentrations exceed 10 times the STLC chromium value (50 mg/kg), and one sample exceeds twenty times the Toxicity Characteristic Leaching Procedure (TCLP) value, thereby classifying these materials as potentially hazardous waste with respect to chromium.

- Lead concentrations in two grab samples GS-1 and GS-2 were detected at 283 and 80.6 mg/kg. These lead concentrations exceed the DTSC HERO residential screening level of 80 mg/kg, and the California hazardous waste criteria for lead (10 times the STLC value of 50 mg/kg). These lead concentrations exceed the maximum background concentrations for lead of 55.3 mg/kg.

- Although other metals were detected, analytical results were either non-detect or below their respective regulatory screening levels and hazardous waste criteria.

15.3. Trench Excavation Samples

Title 22 Metals

- Arsenic concentrations in samples ranged from 1.56 to 13.9 mg/kg with the majority of samples exceeding the residential and industrial RSLs of 0.68 and 3.0 mg/kg, respectively, as well as the DTSC HERO residential and industrial screening levels of 0.11 and 0.36 mg/kg, respectively. Background arsenic concentrations in three samples outlying wastes were higher concentrations than the residential and industrial RSLs. However, background arsenic concentrations which were detected above 3 mg/kg are higher than the residential/industrial RSLs and DTSC HERO screening levels. Two waste samples (T-15-S and T-15-10) contained arsenic at concentrations of 13.0 and 13.9 mg/kg, slightly exceeding the DTSC background concentration of 12 mg/kg used for soil screening on school sites.

- Cadmium was detected in two samples, T-8-2 and T-15-S, at concentrations of 11.1 and 13.0, respectively, exceeding 10 times the STLC value of 1 milligrams per liter (mg/l) (10 mg/kg), thereby classifying these samples as potentially hazardous waste with respect to cadmium. Cadmium concentrations in samples analyzed were less than the residential and industrial RSLs and the DTSC HERO residential and industrial screening levels.

- Chromium concentrations in samples ranged from 5.21 to 894 mg/kg. The highest chromium concentration (894 mg/kg) was detected in a waste sample T-8-2. Chromium concentrations in waste exceeded 10 times the STLC value of 5 mg/l (50 mg/kg), in 15 samples and 20 times the TCLP value of 5 mg/l (100 mg/kg), in 13 samples, thereby classifying these samples as potentially hazardous with respect to chromium. Chromium concentrations in samples analyzed were less than the DTSC HERO industrial screening level.

- Lead concentrations in samples ranged from 1.45 to 7,340 mg/kg. The lead concentrations in most waste samples exceed the residential and industrial RSLs of 400 and 800 mg/kg, respectively. Thirty-one waste samples contained lead at concentrations exceeding the DTSC HERO residential screening level of 80 mg/kg and 11 samples exceeded the DTSC HERO industrial screening level of 320 mg/kg. Two samples (T-2-2 and T-7-S) contained lead concentrations of 7,340 and 1,140 mg/kg, respectively, exceeding the Total Threshold Limit Concentration (TTLC) of 1,000 mg/kg, thereby classifying these materials as California hazardous waste with respect to lead. Lead concentrations exceeded 10 times the STLC value in 38 samples and 20 times the TCLP value in 27 samples, thereby classifying these materials as potentially hazardous with respect to lead. (Figure 8). Lead was detected in 14 of the 15 samples collected from alluvium underlying the WDS ranging in concentrations between 1.45 and 76.8 mg/kg. Lead concentration in soil exceeded 10 times the STLC value in one sample (T-8-10), thereby classifying this material as potentially hazardous with respect to lead. Lead concentrations in waste exceeded 10 times the STLC value of 5 mg/l (50 mg/kg) in 38 samples and 20 times the TCLP value of 5 mg/l (100 mg/kg) in 27 samples, thereby classifying these materials as potentially hazardous with respect to lead. A sample (T-2-2) with the highest lead concentration was additionally analyzed for Synthetic Precipitation Leaching Procedure (SPLP) and TCLP. The SPLP and TCLP lead concentrations were detected at 0.151 and 1.06 mg/l, respectively. The TCLP lead concentration of 1.06 mg/l did not exceed the lead concentration of 5 mg/l, thereby classifying this material as a California hazardous waste. The SPLP lead concentration of 0.151 mg/l is greater than the lead maximum contaminant level (MCL) of 0.015 mg/l by an order of magnitude and could be interpreted as a potential threat to drinking water resources.

- Nickel was detected in two waste samples, T-13-2 and T-13-8, at concentrations of 712 and 360 mg/kg, respectively. These concentrations exceed 10 times the STLC value of 20 mg/l (200 mg/kg), thereby classifying these samples as potentially hazardous with respect to nickel. Nickel concentrations in samples analyzed were less than the residential and industrial RSLs and the DTSC HERO residential and industrial screening levels.

- Thallium was detected in two waste samples, T-13-2 and T-14-8 at concentrations of 1.09 and 1.41 mg/kg, respectively. These concentrations exceed the residential RSL of 0.78 mg/kg. Thallium concentrations in these two samples analyzed were less than the industrial RSL.

Although other metals were detected, analytical results were either non-detect or below their respective regulatory screening levels and hazardous waste criteria.

Total Petroleum Hydrocarbons (TPH)

- TPH diesel concentrations ranged from 1.45 to 13.3 mg/kg in the four samples analyzed each from a different trenches (T-1, T-8, T-16 and T-22). There are no RSLs or hazardous waste criteria for TPH diesel; however, typically a regulatory action level of 1,000 mg/kg is recognized for this COPC. TPH diesel concentrations of the four samples was significantly less than the typical regulatory action level (Table 4).

Polychlorinated Biphenyls (PCBs)

- Six samples were analyzed for PCBs. PCB concentrations did not exceed their respective regulatory screening levels, except for PCB-1260, which was detected at a concentration of 66 mg/kg in in surface sample T-1-S. This concentration exceeds both the residential RSL of 0.24 mg/kg and the industrial RSL of 0.99 mg/kg for soil (Table 5).

Volatile Organic Compounds (VOCs)

- 14 samples were analyzed for VOCs. VOC concentrations were not detected in the samples analyzed at concentrations above their respective laboratory reporting limits. Based on this, analytical results were not tabulated.

Semi-Volatile Organic Compounds (SVOCs)

- 13 samples were analyzed for SVOCs. SVOCs concentrations were not reported in the samples analyzed at concentrations above their respective laboratory reporting limits. Based on this, analytical results were not tabulated.

Organochlorine Pesticides (OCPs)

- Five samples were analyzed for OCPs. OCP concentrations were not reported in the samples analyzed at concentrations above their respective reporting limit. Based on this, analytical results were not tabulated.

16. QUALITY ASSURANCE/QUALITY CONTROL

Field duplicates generally involve collecting two separate samples of the same matrix at the same time and same location, and using the same sampling procedures to document that sampling techniques are consistent and are not influencing the analytical results. However, wastes are inherently heterogeneous, therefore, even if two samples are collected in the same exact manner and side by side, the analytical results will be different and may not be comparable because the

wastes or materials that compose the fill are inherently different. Field duplicates of wastes, were therefore, not a reliable indicator of accuracy, representativeness, or precision and were not be collected.

A trip blank consists of a sample of deionized water provided by the laboratory that is kept with samples to be analyzed for VOCs, after sample collection and during transport to the laboratory. Waste samples collected as part of this investigation are solid, not liquid samples, and will be collected into containers that are not used for liquid samples; therefore, trip blanks are not applicable to this investigation. The proposed sample collection methodology did not require using sampling equipment; therefore, equipment blanks are not required. Numerous solid waste disposal site investigations conducted throughout California have not included field duplicates, trip or equipment blanks.

Data validation associated with the analytical testing included the following:

- Sample holding time
- Sample methods
- Analytical method
- Sample preservation
- COC records
- Detection limits
- Possible transcription errors
- Surrogate recoveries
- Matrix spike recoveries and matrix spike duplicate recoveries
- Calibration checks

Based on the results of the data validation, the analytical results were found to be acceptable for their intended use.

17. RESTORATION AND MANAGEMENT OF INVESTIGATIVE DERIVED WASTES

After completion of field activities, the area of investigation was left in an orderly condition with equipment, unused materials, and other miscellaneous items resulting from, or used in, the assessment removed from the site. Each trench was backfilled with materials excavated from that excavation; therefore, investigative derived waste was not generated during the Phase II ESA. ICS, the excavation subcontractor, backfilled each trench by placing the excavated materials back into the trench in approximately the reverse order of removal. The trenches were backfilled with minimal compactive effort by driving over the excavation using the tracks and bucket of the excavating equipment. The trench excavations were not engineer compacted and compaction testing of the backfilled materials was not performed. The surface areas of the exploratory trenches were generally smoothed out to match the surrounding undisturbed ground surfaces using the excavator blade and rolling over the area with the tracks of the excavating equipment.

18. SUMMARY AND CONCLUSIONS

The following summary and conclusions are provided based on background information and the results of this Phase II ESA.

According to the CalRecycle SWIS database, the Guyaux WDS is a closed, pre-regulation solid waste disposal site (e.g., predates regulations for solid waste disposal sites). The site reportedly ceased operations in December 1985 and is assigned No. 36-CR-0025. According to the SWIS database, there are no inspections or enforcement action records for 36-CR-0025 issued by the County of San Bernardino, Department of Environmental Health, acting as the Solid Waste LEA.

From 1989 to 2010, numerous investigations were conducted at the WDS. Background information from these investigations indicated that in the late 1930s, construction debris such as used bricks, concrete, asphalt, steel, wood, and other deleterious materials generated from the flooding of the City of Colton in 1938 were disposed. In the late 1950s, the WDS was used to store used bricks which were cleaned and re-sold for construction activities. The waste products generated from the used brick cleaning reportedly were used as fill at the WDS. In the 1970s and

1980s, the WDS was used as a waste disposal yard for waste materials generated at the Griffin Wheel Company and the Crane Company (Bechtel, 1996). Background documents and reports indicate that in 1977, the site began to accept "black slag" iron waste from the Griffin Wheel Company (Weston, 1993). Materials disposed of at the WDS reportedly included construction debris, plaster molds, broken porcelain, and waste foundry slag. Reportedly, these waste materials were disposed of directly onto the exposed soil surface. Steel and wood beams were also stored at the WDS for reuse until the mid-1980s (Weston, 1993). From approximately 1985 to the mid-1990s, the WDS was used to temporarily store automobiles and machinery prior to reuse (EEC, 2010). The descriptions of the types of wastes disposed of at the Guyaux WDS are generally consistent with what was observed in the trench excavations.

At the time of the subject Phase II ESA, the WDS was observed to be accessible from surface streets to the north (South Florez and South Fernando Streets) and by unpaved dirt roads located at the eastern and southern perimeter of the waste disposal area. A small portion of fencing exists in the terminus of South Florez Street with a locking gate; however, the fence is damaged and the WDS is accessible to the public.

In March, 2017, Ninyo & Moore conducted a Phase II ESA of the Guyaux WDS within the Project boundary for the purposes of characterizing and delineating wastes and to evaluate the potential presence of cover overlying wastes, as applicable, provide an estimate of the in-place volume of wastes based on locations explored, and to conduct sufficient analytical testing to generally characterize the wastes. The investigation included excavating, logging, sampling and documenting 21 trench excavations within the Project site and one trench excavation on the adjacent, offsite, vacant property to the north (total of 22 exploratory trenches). Due to extreme caving of most trench excavations because of the relatively loose fill soil mixed with waste, much of which consisted of large pieces of debris and the total waste depths (WDS conditions), 13 trenches were extended into the underlying alluvium. Based on conversation with CalRecycle and LEA staff while conducting the Phase II ESA, due to these WDS conditions, they requested that at least one, and if possible, two to three trenches be excavated to the total depth of wastes and into the alluvium, as possible. Locations of trench excavations were based on review of

historical aerial photographs, locations of observed surface wastes, and the geophysical survey. Authoritative protocol was used in the field to adjust and identify locations of exploratory trenches to optimize delineation of waste areas as the investigation proceeded. During the exploratory trenching, groundwater was not encountered.

Concurrent with the Phase II ESA, a geophysical survey was conducted to generally evaluate the locations and lateral extent of the WDS. In general, the geophysical survey delineated the extent of wastes and indicated the presence of anomalous conditions in the area of the waste disposal. The results of the geophysical survey related to the lateral extent of wastes correlated well with the extent of the wastes as delineated during this investigation.

Based on the 22 exploratory trenches, waste was observed at depths ranging from the surface to approximately 19 feet bgs. In general, two types of wastes were observed: construction debris and metal wastes. The construction debris generally consisted of concrete, brick, plaster mold, insulations, tile, wood, toilet, and asphalt which based on background information, appears to be related to historical City flooding and brick cleaning. The metal wastes generally consisted of metal disk molds, slag and what appears to be darkly colored soils/metallic dust (and plaster molds), which based on background information appears to be related to wastes generated from the Griffin Wheel Company and porcelain molds from the Crane Company and disposed of at the WDS. Based on the site reconnaissance and trench excavations, metal and construction wastes were observed to be exposed at the surface.

Based on wastes observed in trenches located at the Project boundaries, and the one trench on the vacant lot to the adjacent north, field observations and information provided by residences in the area, it appears that wastes extend beyond the Project. More specifically, based on waste thicknesses at trenches located at the Project boundaries with residential properties, wastes likely extend offsite and to the north onto residence(s) west of South Fernando Street and to residences both west and east of South Florez Street. Wastes were observed in the trench excavation on the vacant lot to the north of the Project boundary. To the adjacent north of the vacant lot, two residential properties are currently undergoing construction. Based on conversation with a representative of the two properties under construction, the construction debris stockpile located

to the adjacent east was generated during excavation of footings down to 4 feet bgs, indicating wastes extend to these properties. In addition, a nearby resident indicated that debris extended at least to the location of the water pump station approximately two houses north of the Project boundary, on the east side of South Florez Street. Based on trenches at the western Project area, wastes likely also extend offsite to the west, onto a commercial property (Largo Concrete, Inc.).

Based on the locations explored, results of the geophysical survey correlating well with the lateral extent of wastes, and historical aerial photograph interpretation, the lateral extent of wastes was estimated to be approximately 183,000 square feet (ft^2). Assuming an average waste thickness of approximately 15.5 feet, corresponds to an estimated approximately 105,000 cy of wastes. This estimated volume is for the wastes within the Project boundaries only, and does not include wastes that likely, or are known, (vacant lot), to extend offsite onto residential properties to the north and onto the commercial property to the west. Within the Project, wastes were observed to be exposed at the surface and were at the surface at each trench location; indicating the absence of waste cover soil or a cap.

Regarding the ongoing construction of residential properties to the north of the site, although not known, the LEA is required to be notified if wastes are planned to be disturbed at the WDS or within 1,000 feet. Typically, construction of residences on wastes requires regulatory involvement and additional local building requirements.

Samples that contained concentrations of COPCs were compared to applicable screening levels and hazardous waste criteria as discussed below.

Title 22 Metals Arsenic concentrations in samples ranged from 1.56 to 13.9 mg/kg with the majority of samples exceeding the residential and industrial RSLs as well as the DTSC HERO residential and industrial screening levels. Background arsenic concentrations in three samples outlying wastes were higher concentrations than the residential and industrial RSLs. Arsenic was detected in samples collected from alluvium at concentrations greater than the industrial RSL of 3 mg/kg in 7 of 15 samples with the majority of samples exceeding the residential and industrial DTSC HERO screening levels. However, background arsenic concentrations which were

detected above 3 mg/kg are higher than the residential/industrial RSLs and DTSC HERO screening levels. It is recommended that the background concentration of 12 mg/kg established by the DTSC for use on school sites be used for the WDS. Two of the waste samples exceeded the DTSC background concentration.

- Cadmium was detected in two waste samples at concentrations exceeding 10 times the STLC value, thereby classifying this material as potentially hazardous waste with respect to cadmium. Cadmium concentrations in samples analyzed were less than the residential and industrial RSLs and the DTSC HERO residential and industrial screening levels.

- Chromium concentrations in waste samples exceeded 10 times the STLC value, in 15 samples and twenty times the TCLP value, in 13 samples, thereby classifying these materials as potentially hazardous with respect to chromium. Chromium was detected in grab samples GS-1 (metal disc) and GS-2 (vesicular metal slag) at concentrations exceeding 10 times the STLC chromium value, and one sample exceeded 20 times the TCLP value, thereby classifying these materials as potentially hazardous waste with respect to chromium. Chromium concentrations in samples analyzed were less than the DTSC HERO industrial screening level.

- The lead concentrations in most waste samples exceed the residential and industrial RSLs of 400 and 800 mg/kg, respectively. Thirty-one waste samples contained lead at concentrations exceeding the DTSC HERO residential screening level of 80 mg/kg and eleven samples exceeded the DTSC HERO industrial screening level of 320 mg/kg. Two samples contained lead at concentrations exceeding the TTLC of 1,000 mg/kg, thereby classifying these materials as California hazardous waste with respect to lead. Lead concentrations exceeded 10 times the STLC value in 38 samples and 20 times the TCLP value in 27 samples, thereby classifying these materials as potentially hazardous with respect to lead. A sample with the highest lead concentration was additionally analyzed for SPLP and TCLP. The SPLP and TCLP lead concentrations were detected at 0.151 and 1.06 mg/l, respectively. The TCLP lead concentration of 1.06 mg/l did not exceed the lead concentration of 5 mg/l, thereby classifying this material as a California hazardous waste. The SPLP lead concentration of 0.151 mg/l is greater than the lead MCL of 0.015 mg/l by an order of magnitude and could be interpreted as a potential threat to drinking water resources. The lead concentration in one of the 15 samples analyzed from the alluvium underlying the wastes was at a concentration of 10 times the STLC value, thereby classifying this material as potentially hazardous with respect to lead. However, one of the background samples collected at a location outlying wastes also contained lead at a concentration of 10 times the STLC. Based on this and the lead results of the other 14 alluvium samples, it appears that the underlying alluvium is not impacted by lead related to the wastes.

- Nickel concentrations exceeded ten times the STLC value in two waste samples (T-13-2 and T-13-8), thereby classifying these materials as potentially hazardous with respect to nickel.

Nickel concentrations in samples analyzed were less than the residential and industrial RSLs and the DTSC HERO residential and industrial screening levels.

- Thallium was detected at concentrations above the residential RSL in two waste samples. Thallium concentrations in these two samples analyzed were less than the industrial RSL.

TPH-diesel concentrations of the four samples was significantly less than the typical regulatory action level.

PCB-1260 was the only PCB detected in one sample at a concentration which exceeded the residential and industrial RSLs.

VOCs, SVOCs, and OCPs were not detected at concentrations above their respective laboratory reporting limits.

Based on background information and results of this Phase II ESA, the following is recommended at this time.

- This Phase II ESA report should be submitted to the LEA and CalRecycle for their review and comments.
- To the north of the WDS, several existing residential properties, the two residential properties currently undergoing construction, and the vacant lot appear to overlie wastes. The LEA should be notified of the suspected lateral extent of the wastes. In addition, the LEA is required to be notified of any actions that result in the disturbance of wastes or of any project in which the subsurface will be disturbed within 1,000 feet of a WDS. Based on this, although not known, the LEA should have been notified of the current residential construction projects.
- Current conditions at the WDS indicates that at most locations, wastes are exposed at the surface. Analytical results of samples analyzed during this investigation indicated hazardous concentrations of some COPCs at the surface and at shallow depths. These wastes should be immediately covered to meet the requirements of CCR Title 27, Section 21140 - Final Cover for the protection of public health and safety. Such a cover would require approval by the LEA and/or CalRecycle prior to construction and likely submittal of a Post Closure Land Use (Plan) or similar plan. The WDS should be restricted from public access, per CCR Title 27 Section 21135; this would be best accomplished by construction of a perimeter fence. Signage should be posted on the perimeter fencing to further restrict public access.
- Although not investigated, it appears some residential properties to the north and one commercial property to the west overlie wastes. Construction or development of properties

that are the locations of waste disposal requires notification to the LEA and possibly other regulatory agencies prior to beginning construction/development. Regulatory agencies typically have requirements for such projects for the protection of human health and the environment and to meet applicable regulatory requirements. In addition, lead was detected in a sample from the trench excavated on the vacant parcel to the north at a concentration exceeding residential and industrial RSLs and exceeding hazardous waste criteria and stockpiled wastes are present east of the two properties currently being developed with homes. It is recommended that the LEA be notified in writing of the conditions of the WDS and the construction projects overlying wastes.

- The City should be informed of the requirements for this WDS by discussing the results of this investigation with LEA and/or CalRecycle staff.
- Although based on the types of wastes (primarily inert construction debris and metallic debris), absence of municipal solid wastes, and absence of VOCs and SVOCs in samples analyzed; because wastes appear to underlie residential properties and the proximity of other residences and an industrial business west of the WDS, the LEA may require a landfill gas investigation. Such an investigation would likely consist of constructing and monitoring landfill gas wells. In addition, the LEA may have requirements related to the construction of residential properties overlying wastes (e.g., passive venting).
- The LEA may want to resume quarterly inspections of the Guyaux WDS based on the current site conditions.

19. LIMITATIONS

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Variations in site conditions may exist and conditions not observed or described in this report may be encountered during subsequent activities. Please also note that this study did not include an evaluation of geotechnical conditions or potential geologic hazards.

Ninyo & Moore's opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited subsurface assessment and chemical analysis. Further assessment of potential adverse environmental impacts from past onsite and/or nearby use of hazardous materials may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are

believed to be representative of the area(s) evaluated; however, conditions can vary significantly between sampling locations. Variations in soil and/or groundwater conditions will exist beyond the points explored in this evaluation.

The environmental interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the subject site. The testing and analyses have been conducted by an independent laboratory which is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document. This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

Notes:
EPA - United States Environmental Protection Agency
RSL - EPA Regional Screening Level, May 2016.
DTSC - California Department of Toxic Substances Control
HERO - DTSC Human and Ecological Risk Office (HERO), Human Health Risk Assessment, Note Number: 3, Cancer Value, DTSC-modified Screening Levels, June, 2016
DTSC Background Concentration - Determination of a Southern California Regional Background Arsenic Concentration in Soil, G. Chernoff, W. Bosan and D. Oudiz, March, 2008
Gray shading indicates sample was collected in waste
Yellow shading indicates sample was collected in alluvium, underlying waste
Blue shading indicates concentration exceeds the residential RSL
Green shading indicates concentration exceeds the industrial RSL
Purple shading indicates concentration exceeds the HERO Residential Screening Level
Tan shading indicates concentration exceeds the HERO Industrial Screening Level
Orange shading indicates concentration exceeds the DTSC Background Concentration
bold indicates analyte detected at a concentration equal to or exceeding the laboratory reporting limit
Italics indicates concentration exceeds the TTLC
blue indicates concentration (when compared to Hazardous Waste Criteria) exceeds 10 times the STLC and/or 20 times the TCLP and therefore may be classified as a potential hazardous waste for that metal
ID - identification
NA - not applicable
NL - not listed
mg/kg - milligrams per kilogram
mg/l - milligrams per liter
TTLC - Total threshold limit concentration - maximum allowable concentration for California Hazardous Waste (California Code of Regulations [CCR] Title 22, Section 66261.24)
STLC - Soluble threshold limit concentration - maximum soluble limit concentration for California Hazardous Waste (California Code of Regulations [CCR] Title 22, Section 66261.24)
TCLP - Toxicity characteristic leaching procedure - maximum leachable concentration for California Hazardous Waste (California Code of Regulations [CCR] Title 22, Section 66261.24)

Table 4 - Summary of Detected TPH Analytical Results

Location ID	Sample ID	Sample Date	TPH-diesel by EPA Method 8015M (mg/kg)
T-1	T-1-S	3/21/2017	13.3
T-8	T-8-S	3/21/2017	11.0
T-16	T-16-10	3/23/2017	1.58
T-22	T-22-15	3/23/2017	1.45

Notes:

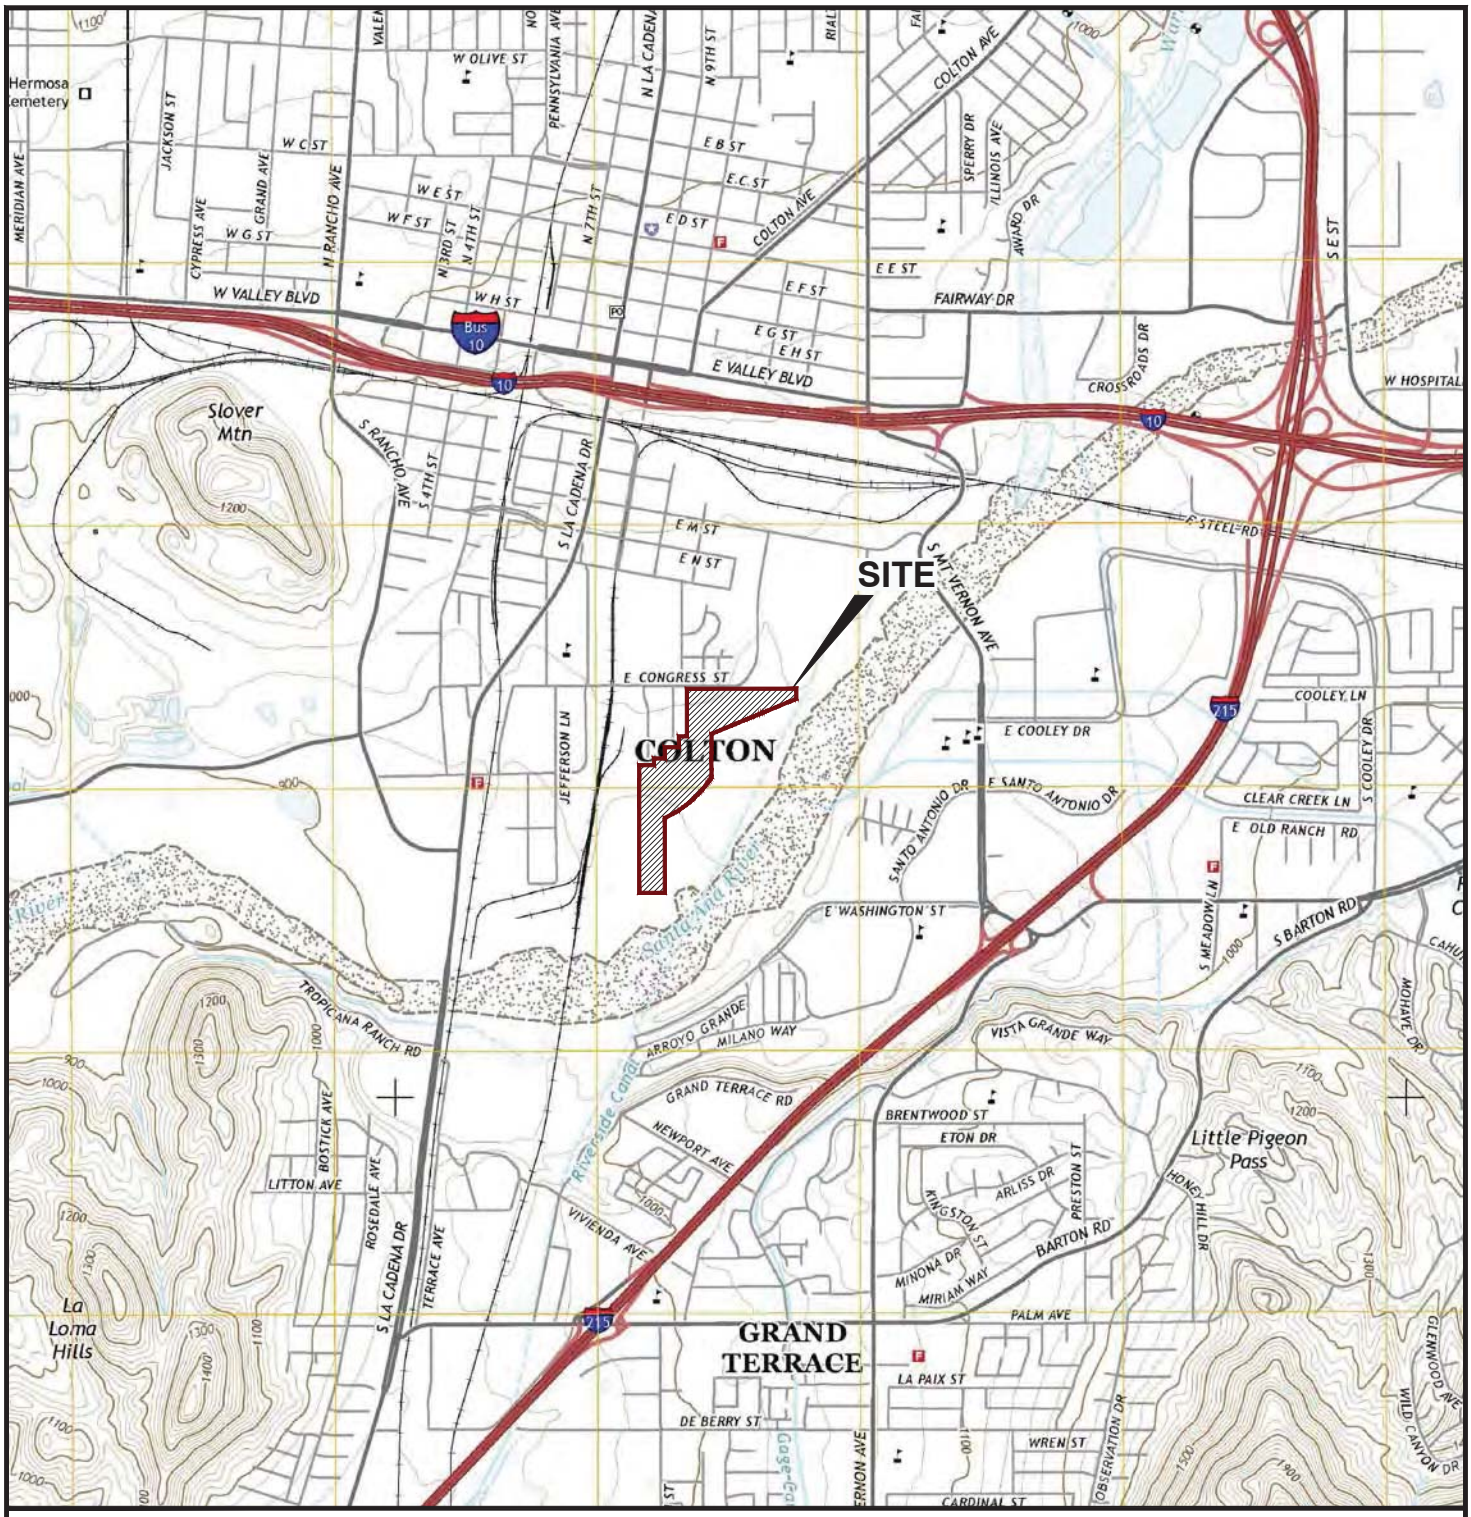
bgs - below ground surface

EPA - United States Environmental Protection Agency

ft bgs - feet below ground surface

ID - identification

mg/kg - milligrams per kilogram



Only constituents with concentrations exceeding the laboratory reporting limit are summarized above. See laboratory reports for additional details.

TPH - Total petroleum hydrocarbons

Table 5 - Summary of Detected PCB Analytical Results

Location ID	Sample ID	Sample Date	PCBs by EPA Method 8082 (mg/kg)		Wastes Depth (ft bgs) (wastes thickness in feet)
			PCB-1260	Other PCBs	
T-1	T-1-S	3/21/2017	***66***	ND	0.5
Regulatory Screening Levels					
EPA RSL Residential (mg/kg)			**0.24**	**NA**	
EPA RSL Industrial (mg/kg)			*0.99*	*NA*	

Notes:
Italics - Concentration indicates sample exceeds EPA RSL assuming Industrial land use
Bold - Concentration indicates sample exceeds EPA RSL Residential assuming residential land use
EPA - United States Environmental Protection Agency
ft. bgs - feet below ground surface
ID - identification
mg/kg - milligrams per kilogram
NA - not applicable
ND - not detected
Only constituents with concentrations exceeding the laboratory reporting limit are summarized above. See laboratory reports for additional details.
PCBs - polychlorinated biphenyls
RSL - Regional Screening Levels, United States Environmental Protection Agency, Summary Table, May 2016.

SUBJECT: WORK PLAN FOR PHASE II ENVIRONMENTAL SITE ASSESSMENT, GUYAUX WASTE DISPOSAL SITE (SWIS NO. 36-CR-0025)

Dear Mr. Martin:

On January 31, 2017, the Local Enforcement Agency (LEA) of San Bernardino received the Work Plan for Phase II Environmental Site Assessment (ESA) for Guyaux Waste Disposal Site, Terminus of South Florez and Fernando Streets, Colton, California 92324 (SWIS No. 36-CR-0025). The plan presents procedures for conducting the Phase II ESA that will evaluate the locations, types, and extent of wastes related to the waste disposal site.

San Bernardino County LEA and CalRecycle have reviewed the proposed work plan. With guidance from CalRecycle, the LEA has determined that Guyaux Waste Disposal Site may proceed with the proposed plan with the following provision:

- ✓ If during the intrusive investigation it is determined that there has been waste deposited that has the potential to produce gas, then landfill gas probes should be constructed at the property boundary adjacent to the homes.

If you have any questions or comments please contact me, Yong Aday of San Bernardino County LEA at (800) 442-2283 or by e-mail at: yong.aday@dph.sbcounty.gov.

Sincerely,

Yong Aday, REHS II

WORKPLAN
for
SITE INVESTIGATION

at

South Colton Site
Parcels 016336212, 016336226, and 016336227
Colton, California

1.0 INTRODUCTION

On behalf of The Maturin Group (Maturin) , Environmental Engineering & Contracting (EEC) has prepared this workplan to remediate lead-impacted soil at the above referenced site (Subject Property). The Subject Property location is presented on Figure 1. During previous investigation activities performed at the Subject Property, elevated concentrations of lead were identified in shallow soil at three locations. To remediate soil at these locations EEC is proposing to excavate and dispose of the lead containing soil. All activities will be performed under the direct oversight and approval of the Regional Water Quality Control Board – Santa Ana Region (RWQCB) and a State of California Professional Geologist (PG). This workplan outlines the technical approach for the remedial action.

2.0 BACKGROUND

The following section of this workplan presents background information for the Subject Property. Information described in this section includes a description of: site location, topography, geology, hydrogeology, history of the former Guyaux Landfill, and the intended future use of the Subject Property.

2.1 Site Location

The Subject Property is located at the southern end of the City of Colton, adjacent north of the Santa Ana River (Figure 1). More specifically, it extends south from the ends of Flores and Fernandez Streets. The Subject Property has an irregular shape and consists of three undeveloped vacant parcels, totaling approximately 29 acres. Several dirt trails traverse the Subject Property, which appear to be regularly used. These parcels are:

- Lot 20 – Assessor's Parcel Number 016336212, consisting of 16.931 acres zoned as open space.
- Lot 21 – Assessor's Parcel Number 016336226, consisting of 10.003 acres zoned as open space.
- Lot 34 – Assessor's Parcel Number 016336227, consisting of 1.122 acres zoned as open space.

The northern portion of the site contains a former uncapped and unlined waste disposal site (the Guyaux Landfill) and the remainder of the Subject Property has always been and is currently undeveloped land. The proposed soil remediation is located within the former Guyaux Landfill, which is the northern most portion of the Subject Property (Figure 2). Electrical transmission and distribution pole easements cross the north side of the project site and the adjoining properties in an east-west direction. Existing development in the immediate vicinity of the project site is a mix of industrial and residential land uses. The site is bounded

north by residential properties, to the west by railroad tracks and industrial properties, and to the south and east by vacant property and the Santa Ana River.

2.2 Topography

The topography for the Subject Property generally slopes from north to south with a slight slope from east to west, which is the general trend of the Santa Ana River. There is a drop in elevation of approximately 25 feet from the northeast portion to the southwest portion of the Subject Property. The elevation in the northeast portion of the Subject Property is approximately 935 feet above mean sea level (msl) and approximately 910 feet above msl in the southwest portion of the Subject Property.

There is numerous drainage swales located throughout the Subject Property and generally have a northeast to southwest trend. The size and shape of the drainage swales have appeared to be influenced by fill material and by storm water runoff from the properties located to the north of the Subject Property.

2.3 Regional and Site Geology

The Subject Property is located within the Peninsular Range Geomorphic Province on the central portions of a large alluvial plain. The large alluvial plain was formed from several large alluvial fans created from the San Gabriel and San Bernardino Mountains and from wash deposits from the Santa Ana River. The Subject Property is located in the central portion of the Perris Block. There are no known faults (active, potentially active, or inactive) located at the Subject Property, however the Rialto-Colton Fault is located less than 3 miles to the north. The San Jacinto Fault Zone is located to the east, the Elsinore Fault Zone is located to the west, and the Cucamonga Fault Zone is located to the north of the Perris Block.

The Subject Property is underlain by a mixture of non-engineered undocumented artificial fill and alluvial wash deposits. These materials overlay older alluvial wash deposits from the Santa Ana River. Soils encountered during drilling activities in November 2009, consisted of sandy silts and silty sands in the upper ten feet, and sands and gravelly sands from approximately 10 feet below ground surface to approximately 50 feet below ground surface (termination of borings).

2.4 Site Hydrogeology

Four groundwater monitoring wells were installed and developed at the Subject Property in September 2009. In October 2009, depth to groundwater in wells MW-1 through MW-4 was measured from approximately 85 to approximately 94 feet below ground surface (bgs).

2.5 History of the Guyaux Landfill

The Guyaux Landfill was formerly located in the northern portion of the Subject Property and is the focus area of this workplan. The property was previously identified as a potential hazardous waste site and was investigated by U.S. Environmental Protection Agency (EPA) Region IX. A preliminary assessment (PA) was performed by Roy F. Weston in June 1993. A site investigation (SI) was performed in June 1995 and an expanded site investigation was performed in August 1996 by Bechtel Environmental Incorporated.

The Guyaux Landfill comprises about four acres and is topographically approximately 15 feet higher than the remainder of the site. The previous investigations indicate that waste materials were dumped on the site from the 1930s through the 1980s. Based on information obtained from a Phase II Environmental Site Assessment

and Site Investigation report prepared by EastStar Environmental Group, Inc (EastStar), approximately 98,000 cubic yards of waste material and soil were placed in this area. Disposal into the dump has reportedly included:

- Construction debris from rebuilding the City of Colton in the 1930s
- Brick and construction material recycling in the 1950s
- Foundry slag from Griffin Wheel Company and broken porcelain and plaster molds from Crane Company in the 1970s and 1980s

The surface of the site was an unofficial junkyard for car and machinery dismantling from 1985 through the mid-1990s. No disposal activities appear to have taken place on the landfill since the mid-1990s. The previous reports noted empty drums on the landfill surface and partially buried drums on the southern and eastern landfill faces. No drums were observed during EastStar's investigation. Municipal solid and green wastes do not appear to have been disposed in the dump. The disposal area does not appear to be lined. The top surface of the area is unpaved. The ground surface consists of relatively permeable sandy soil. Sparse vegetation, consistent with the remainder of the property, is growing on the landfill surface and side slopes. Some voids and possible settlement sink holes were apparent in the landfill surface and the exposed side slopes, during previous investigations.

Waste disposal appears to have occurred against a natural embankment formed by the former path of the Santa Ana River along the north and west sides of the disposal area. The fill then extends to the south and east to a 10 to 15 foot high face on the south and east sides of the four acre disposal area. Previous site investigation reports indicated that the area may have been regraded; indicating that the actual lateral extent of the landfill may extend beyond this face. There is no indication that the waste disposal area has ever been capped.

2.6 Development of the Subject Property

The property owner intends to raise the grade of the Subject Property out of the floodway using imported engineered fill. The fill will be blended, screened and processed to produce a high quality borrow material that will be used to form the engineered fill. All incoming soil will be fully characterized before it is delivered to the site.

Accepted soil will be screened and used as the raw material to manufacture the engineered backfill. The engineered fill will raise the grade of the site and will accomplish the following goals:

- Remove the property out of the 100-year floodplain by elevating the site.
- Reduce the existing fugitive dust conditions at the adjoining residential properties from wind blowing over the existing fine, loose soils on the site.
- Fill and grade the site with an engineered fill containing superior overall strength characteristics and bearing capacity, compared to the existing site soils.
- Cover the existing Guyaux Landfill impacted area to prevent direct contact exposure to the dump, limit percolation and remove the risks associated with open voids on the surface and face of the dump.

The engineered fill project will require approximately 500,000 cubic yards of product.

3.0 PROPOSED FIELD WORK

The goal of the proposed remedial activities is to remove three relatively small areas of soil from which elevated concentrations of lead were detected during previous onsite sampling. The following summarizes the proposed scope of work to remedial areas of concern.

3.1 Pre-Field Activities

The following activities will be performed prior to initiating field activities.

3.1.1 Regulatory Notifications

EEC will notify the RWQCB a minimum of 72 hours prior to commencing field activities.

3.1.2 Underground Service Alert Notification

In compliance with California Government Code Section 4216-4216.9, EEC will mark the proposed soil remediation locations with white paint and marker flags so that the proposed locations are visible to underground surface alert (USA) members. USA is a regional notification center that notifies owners and operators of subsurface utilities (water, gas, electric, sewer, oil lines, etc.) and informs them of a contractors' intent to perform subsurface work. EEC will notify USA of the intent to perform subsurface work 48 hours prior to the beginning of the onsite activities.

3.1.3 Site Health and Safety Plan

EEC will conduct field work at the site in accordance with the protocols established in EEC's Site Health and Safety Plan (H&SP). The H&SP will address the potential health hazards that might be encountered at the worksite and describe the basic safety procedures that EEC personnel and subcontractors will follow during field activities. Each morning prior to commencing work, a tailgate meeting will be held to continuously reinforce field personnel with potential safety concerns. The H&SP will be available onsite during all field activities. A copy of the H&SP is included as Appendix A.

3.2 Field Activities

The following section of this workplan describes the onsite activities that will be conducted during the removal of lead impacted soil at the Subject Property. EEC assumes that the proposed scope of work will be completed in one field day.

3.2.1 Remedial Excavation Activities

Soil containing elevated concentrations of lead will be remediated at the Subject Property by excavation. EEC will utilize a backhoe to remove impacted soils at each location. It is assumed that one to two drums per excavation will be required to remove lead exceeding the action level of 1,000 milligrams per kilograms (mg/kg) to complete the remedial project. The following table presents the approximate size of each excavation based on the depth of the impacted soil horizon.

Excavation ID	Depth of Lead Detection (feet)	Proposed Excavation Size	Proposal Drum Totals
A	1.5	1.5 x 1.5 x 2	1
B	3.5	1.5 x 1.5 x 3.5	2
C	2	1.5 x 1.5 x 2.5	1

If elevated concentrations of lead are detected in the confirmation samples collected, EEC will return to the Subject Property and excavated an additional one foot of material and re-collect confirmation samples. This process will be repeated until laboratory results indicated that soil contained lead greater than 1,000 mg/kg has been removed. Each excavation location will be recorded utilizing a hand held global positioning system (GPS) hand held unit for future reference.

3.2.2 Soil Sampling Procedures

One undisturbed soil sample will be collected from the bottom of each remedial excavation. Once the total depth of each excavation is reached, a soil sample will be collected by advancing a soil core sampler, with a slide hammer, containing a 2-inch diameter by 6-inch long stainless steel sampling sleeve into undisturbed soil. Once the sampling sleeve has been filled with soil, it will be removed from the core sampler. The ends of the sleeve will be sealed with Teflon and covered with plastic end caps. The stainless steel sleeves will be labeled with the date and time of collection and a sample identification number. The samples will then be sealed in a plastic bag and placed in a chilled ice chest immediately after collection. Within 24 hours, the samples will be relinquished under standard Chain-of-Custody protocols to a State-certified laboratory for analyses.

3.2.3 *Sampling Equipment Decontamination*

The equipment utilized during soil sampling will be decontaminated between each consecutive use in accordance with the following procedures:

1. Rinse with water using a brush to remove soil and mud.
2. Wash with a non-phosphate detergent and water using a second brush.
3. Double rinse with water.
4. Allow equipment to air dry before reuse.

4.0 LABORATORY ANALYSIS

The collected soil samples will be stored in a chilled ice chest until relinquished under standard Chain-of-Custody protocols to a State certified analytical laboratory for analyses. The soil samples will be analyzed in accordance with EPA Method 6010/7410 for lead.

In addition, one soil sample will be collected from the contained material associated with each excavation for classification purposes. The classification sample, used to determine disposal classification, will be analyzed for lead by EPA Method 6010/7410, Soluble Threshold Limit Concentration (STLC) and the toxicity

characteristic leaching procedure (TCLP) for lead (if necessary), total petroleum hydrocarbons by EPA Method 8015, and VOCs by EPA Method 8260B.

5.0 WASTE MANAGEMENT

The excavated soil generated will be contained in a Department of Transportation (DOT) approved steel 55-gallon drum during field activities. Once the analytical data has been returned from the laboratory and reviewed the soil will be profiled for disposal. Following profiling the soil will be transported offsite under manifest for proper disposal. A copy of the waste manifest will be included in EEC's final report documenting the remedial event.

6.0 DATA EVALUATION AND REPORT PREPARATION

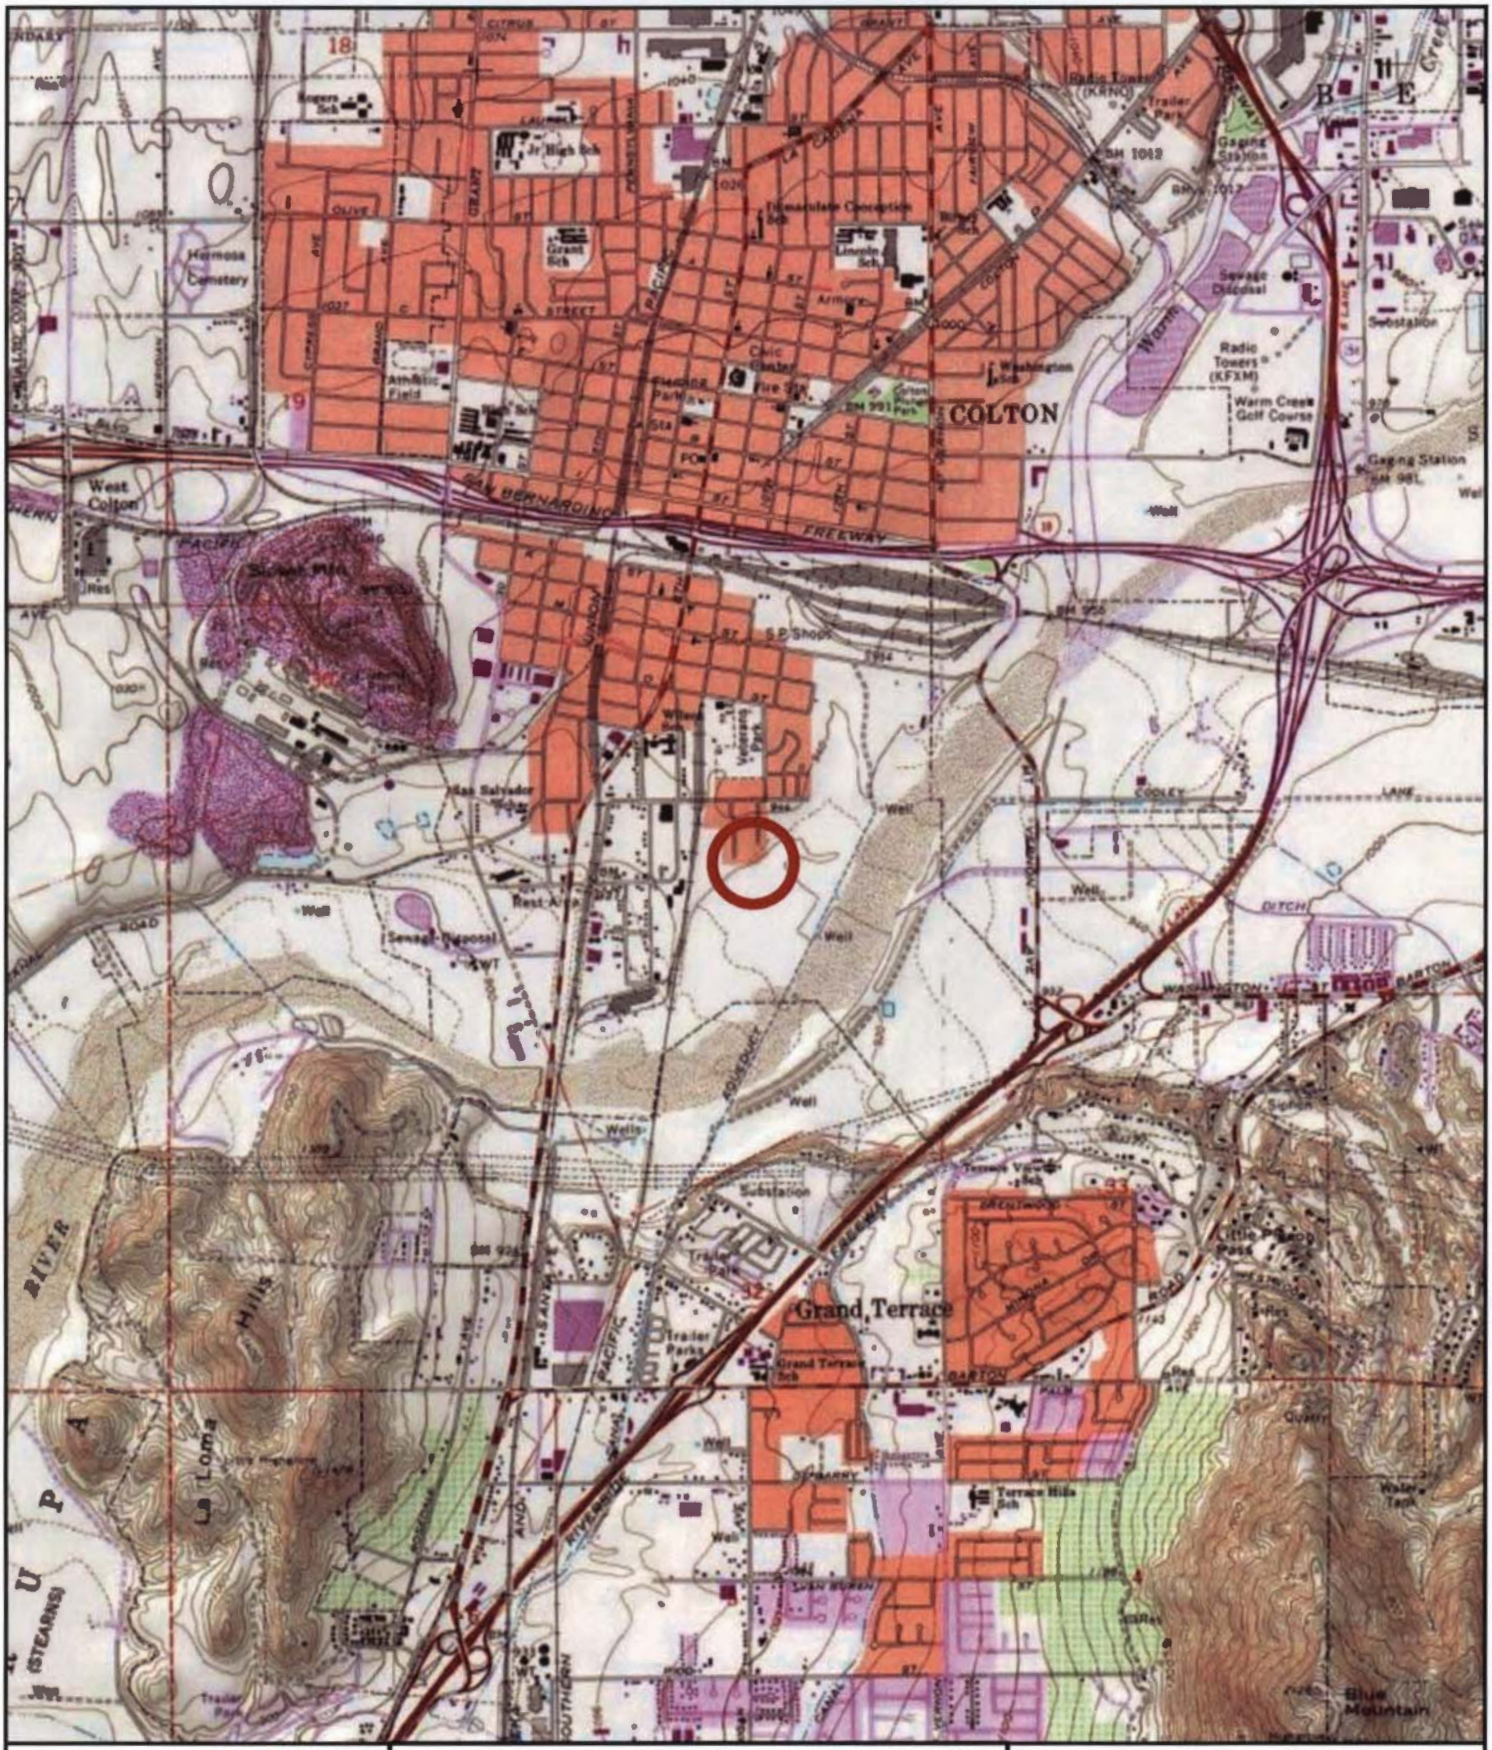
After completion of the remedial activities and laboratory analyses, EEC will evaluate the analytical data and prepare a technical report for submittal to the RWQCB.

The report will summarize the following:

- Introduction and background of the site;
- Remedial field activities and sampling procedures;
- Laboratory analytical results; and
- Conclusions and recommendations.

The report will also contain the following documentation:

- Tables summarizing laboratory test results of soil samples;
- Figures showing the site location, site plan, remedial excavation locations, and sample locations;
- Waste disposal manifest; and
- Laboratory analytical reports and Chain-of-Custody forms.



All field work and report preparation will be directly supervised by a California Professional Geologist.

ENVIRONMENTAL ENGINEERING AND CONTRACTING
SITE HEALTH AND SAFETY PLAN

1.0 INTRODUCTION

This Site Health and Safety Plan (SHSP) has been developed specifically for subsurface environmental investigations in which lead may be encountered in the soil. The purpose of this document is to provide detailed information regarding anticipated site health and safety matters, and establish policies and procedures adequate to protect workers, the public, and environment from predicted site hazards. The information provided in this plan is based, in part, on best available information regarding the site. If unexpected health and safety issues arise during the course of the investigation, this plan will be modified to reflect these new conditions. The conditions detailed in this SHSP apply to EEC employees and its subcontractors working on the site. A copy of this SHSP will be available at the site during all field activity.

While based on the minimum requirements of 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response (HAZWOPER), this document has been developed with the express purpose of implementing a high quality safety and health program. These SHSP guidelines are a "living document" to be modified and updated as new regulations and other requirements are issued.

2.0 CHAIN OF COMMAND AND KEY PERSONNEL

All EEC personnel have key responsibilities in maintaining a high quality site health and safety program. The responsibilities of each employee are discussed in the following sub-sections. An organizational chart is shown on the following page.

2.1 Health and Safety Officer

EEC's Health and Safety Officer (HSO) is responsible for the implementation and compliance with applicable regulations and guidelines established in this SHSP. The HSO has ultimate responsibility for site health and safety issues and has "stop work" authority. In addition, the HSO has the following responsibilities:

- Compliance with health and safety training and medical surveillance requirements;
- Periodic site inspections to evaluate SHSP implementation;
- Verifying each employees' suitability for work based on employee training and physician recommendation;
- Periodically inspecting protective clothing and equipment;
- Advising medical personnel of potential exposure and consequences;
- Participating in the preparation and implementation of the SHSP;
- Coordinating emergency medical care.

2.2 Project Manager

EEC's Project Manager is responsible for developing the SHSP based on available knowledge of the site. The Project Manager is directly responsible for the performance of all EEC personnel and EEC subcontractors at the site. In the event that the Project Manager becomes aware of any deficiencies in the implementation of the SHSP, this individual may recommend changes to the plan or interpretation of the plan and will take appropriate action by consulting with the HSO. In addition, the Project Manager has the following responsibilities:

- Management of the project;
- Preparation of the work plan, preparation of the HASP, and designation of the field team;
- Designation of an individual within each project to act as the on site health and safety coordinator;
- Assuring that subcontractors are in compliance with EEC health and safety requirements;
- Identifying work-site confined spaces;
- Granting access permission for visitors, new hires, etc., and coordinates activities with appropriate officials;
- Confirming each team member's suitability for work base on employees training and physician's recommendation;
- Briefing field teams on their specific assignments;
- Coordinating with the HSO on safety and health requirements;
- Liaison with public officials; and

2.3 Field Team Lead - Staff Engineer/Geologist/Engineer

EEC's field team leader will be responsible for assessing and enforcing health and safety practices at the site, and shall be present during all work activities. The Field Team Leader will conduct a project-specific meeting discussing safety issues and project objectives before beginning work. If respiratory protection is required, the Field Team Leader will be responsible for conducting fit testing of the respiratory protective devices. The Field Team Leader will also relay any observed health and safety deficiencies, hazards, or changes in site conditions immediately to the Project Manager. The Field Team Leader has the following responsibilities:

- Management of field operations;
- Execution of the work plan and schedule;
- Conducting daily tailgate safety meetings;
- Recording names and job assignments of on site personnel;
- Assuring compliance with Hazard Communication Standards;
- Conducting health and safety inspections on a daily basis, including the observing personnel for signs of impaired health due to contaminant exposure, heat stress, or other stresses;
- Coordinating with the Project Manager or HSO in determining protection levels;
- Inspecting personal protective equipment, verify its use, and proper decontamination;
- Recording employee illness/injuries and report on exposure monitoring results (if required);
- Controlling site entry and exit;
- Reporting infractions or incidents to the Project Manager or HSO;
- Maintaining communication with working parties;
- Obtaining emergency assistance;
- Documenting field activities;

2.4 Field Personnel and Subcontractors

All EEC personnel and subcontractors have the responsibility to read the SHSP and understand their assigned tasks, and how to perform those tasks in accordance with the SHSP. Each individual is responsible for informing a supervisor of any health and safety hazards, symptoms of exposure, injury, malfunctioning equipment, identification of any previously unknown contaminant, or other unanticipated condition. All EEC employees and subcontractors must attend all required safety course work and meetings and maintain documentation indicating that they have completed the same. All employees and subcontractors are required to wear personal protective equipment when requested (employees and contractors are allowed to modify personal protective equipment requirements, but only in a manner which increase the minimum safety requirements). Employees or contractors who refuse or fail to follow the standards set forth in this SHSP are subject to disciplinary action, which may include dismissal from the site. In all cases not specifically mentioned, employees and contractors are expected to use good judgment and shall refer all questions to appropriate supervisors and health and safety personnel.

2.5 All Parties

All personnel entering the site will be required to review the SHSP and document such review prior to actual work at the site. No personnel will be permitted to enter restricted areas without approval of the Project Manager or Field Team Leader.

3.0 HAZARD ASSESSMENT

Personnel at the site may be exposed to both chemical and physical hazards. All personnel who enter the site have the potential to be exposed any or all of these hazards. The following personnel may be present on site during the project:

- Project Manager
- Field Team Leader
- Staff Personnel
- Technicians
- Drillers
- Heavy Equipment Operators
- Management Representatives

3.1 Chemical Hazards

This section discusses major contaminants that may be encountered in the work environment during this project. The primary contaminants anticipated to be encountered during this investigation are indicated in Table 1. The primary health hazards associated with these substances are provided in Table 1. Applicable 8-hour permissible exposure limits (PELs) and threshold limit values (TLVs) are also listed in Table 1. These exposure limits are not anticipated to be exceeded. A discussion of PELs and TLVs are included in Appendix A. If other chemical compounds are later identified to be present at the site, an addendum to this SHSP describing the health hazards, PELs and TLVs will be prepared.

Potential exposure pathways at the site include inhalation, dermal contact, and ingestion. Protective clothing,

including gloves, will be mandatory for all personnel who may potentially come in contact with the contaminants. In addition, air purifying respirators with organic vapor HEPA filters, will be required if the PELs are exceeded in the breathing zone, or if an employee elects due to discomfort.

For each constituent identified in Table 1, the known toxic effects, routes of entry, and target organs are indicated. This information will be communicated to all onsite personnel during tailgate safety meetings prior job start up.

TABLE 1
EXPOSURE LIMITS AND HEALTH HAZARDS OF POTENTIAL CONTAMINANTS

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Acetone	750/750 ppm REL = 250 ppm	STEL = 1000 ppm C = 3000 ppm	Minty sweet odor – 20 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; dizziness	Dermatitis
	Ammonia	25/25 ppm	STEL = 35 ppm	Pungent, irritating odor – 0.04 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation/burning	None cited
	Antimony	0.5/0.5 mg/m^3	None cited	None cited	Inhalation; Ingestion	Eye, skin and mucous membrane irritation	Pneumoconiosis
	Arsenic	0.01/0.1 mg/m^3	NIOSH Ceiling = 0.002 mg/m^3	Odorless solid	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation	Confirmed human carcinogen; lung, skin and lymphatic cancer; GI and skin disorders; peripheral neuropathy
	Asbestos (all forms)	0.1 f/cc/ None cited Amosite (0.5 f/cc) Chrysotile (2 f/cc) Cricidolite (0.2 f/cc)	STEL = 1 f/cc (30 minute TWA)	Asbestos fibers do not have warning properties	Inhalation; Ingestion	None cited	Asbestosis confirmed; known human carcinogen; cancer of the lungs and digestive tract; mesothelioma.
	Boron oxide	10/10 mg/m^3	None cited	None cited	Inhalation; Ingestion	Eye and respiratory irritation	None cited
	Barium, soluble compounds	10/10 mg/m^3 (as total dust)	None cited	White, odorless solids	Inhalation; Dermal; Ingestion	Eye, skin, and respiratory irritation	Neuromuscular disturbances; pneumoconiosis; heart problems
	Benzene	1/10 (0.1) ppm [SKIN]	STEL = 5 ppm TLV-STEL = 0.3 ppm	Sweet solventy odor – 1.5 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; nausea	Confirmed human carcinogen; leukemia; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Beryllium	0.002/0.002 mg/m^3	Ceiling = 0.025 mg/m^3 STEL = 0.005 (30 min)	Grey, odorless solid	Inhalation	Dermatitis; pneumonitis; respiratory irritation; spontaneous	Berylliosis; suspected human carcinogen
	n-Butyl acrylate	10/10 ppm	None cited	Fruity odor – 33 ppm	Inhalation; Dermal	Eye and skin irritation	Dermatitis
	Cadmium (metal dust and soluble salts)	0.005/0.01 mg/m^3 (0.01 mg/m^3 total dust; 0.002 mg/m^3 respirable dust)	OSHA Ceiling = 0.6 mg/m^3 ACGIH (respirable dust = 0.002 mg/m^3)	Odorless solid	Inhalation; Dermal; Ingestion	Skin and respiratory irritation; pulmonary edema; CNS effects; nasal perforation	Emphysema; kidney damage; anemia; suspected human carcinogen
	Carbon disulfide	4/10 ppm	STEL = 12 ppm	Ether-like irritating sweet odor – 0.01 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS and peripheral nervous system depression; headache; dizziness	Possible liver, kidney and cardiovascular injury; peripheral neuropathy
	Carbon monoxide	35/25 ppm	C = 200 ppm	Colorless, odorless gas	Inhalation	Chemical asphyxiant; CNS depression.	Possible neuropsychiatric damage
	Cesium-137	None cited	1.25 REM/qtr	None cited	Inhalation; Dermal	Bone marrow destruction; anemia; infection; GI disturbances; eye, skin, and respiratory damage; deathly	Cancer; sterility; leukemia; diseases of bone marrow
	Chlordane	0.5/0.5 mg/m^3	[SKIN]	Pungent, chlorine-like odor	Inhalation; Dermal; Ingestion	Skin, GI and respiratory irritation; tremors and convulsions; blurred vision; confusion	Liver, kidney and respiratory damage; dermatitis; suspected human carcinogen
	Chlorobenzene	75/10 ppm	None cited	Sweet almond odor – 0.2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; skin burns	Possible liver, kidney and lung damage; dermatitis
	Chromium (metal and di/tri valent compounds)	0.5/0.5 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Respiratory irritation	Possible lung fibrosis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Chromium (hexavalent compounds)	0.05/0.05 mg/m^3	C = 0.1 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and nasal ulcerations	Possible liver and kidney damage; dermatitis; suspected human carcinogen
	Chrysene	Note cited	None cited	None cited	Inhalation; Dermal	Skin irritation	Suspected human carcinogen
	Cresol (all isomers)	5/5 ppm	[SKIN]	Sweet tar odor – 0.0003 ppm	Inhalation; Dermal; Ingestion	Eye, skin, and respiratory irritation; CNS depression; GI disturbances; skin and eye burns	Possible liver, kidney, and lung damage; dermatitis
	Copper (salts, dusts, and mists)	1/1 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; metal fume fever; nasal ulceration and perforation	Respiratory irritation; dermatitis; possible liver, kidney damage
	Crude Oil	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Possible CNS depression; irritation of skin and mucous membranes.	Possible dermatitis
	Cumene (isopropyl benzene)	50/50 ppm	[SKIN]	Sharp aromatic odor – 0.008 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Dermatitis
	Cyclotrimethylene-trinitramine (component of RDX)	1.5/1.5 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Headache; nausea; vomiting; amnesia; malaise; fatigue; unconsciousness	Chronic intoxication is characterization by the occurrence of repeated convulsions
	Cyclotetramethylene-tetranitramine (component of HMX)	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	None cited	None cited
	Cyanide (hydrogen cyanide)	None cited	C = 4.7 ppm or 5 mg/m^3 [SKIN]	Bitter almond odor – 0.8 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritant; chemical asphyxiant; respiratory paralysis	Possible damage to CNS, CVS, liver and kidneys

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Dibenzo-dioxins	None cited	None cited	None cited	Inhalation; Dermal	Chloracne	Highly toxic; suspected human carcinogen
	Dibenzo-furans	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Chloracne	Highly toxic; suspected human carcinogen
	DDT (dichlorodiphenyl-trichloroethane)	1,1 mg/m^3	None cited [SKIN]	None cited	Ingestion; Dermal and Inhalation are secondary	Dizziness; tremor; confusion; nausea; eye and skin irritation	CNS effects; dermatitis; kidney damage; potential human carcinogen
	Dichloro-difluoromethane (freon 12)	1000/1000 ppm	C = 6200 ppm	None cited	Inhalation; Dermal; Ingestion	CNS depression; cardiac arrhythmia	None cited
	1,1-Dichloroethane (DCA)	100/100 ppm	TLV-STEL = 250 ppm	Chloroform odor – 110 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; acute effect.
	1,2-Dichloroethane (ethylene dichloride)	1/10 ppm	STEL = 2 ppm C = 200 ppm	Sweet odor – 6 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Liver and kidney damage; dermatitis; suspected human carcinogen
	1,1-dichloroethylene (vinylidene chloride; 1,1-dichloroethene; or DCE)	1/5 ppm	TLV-STEL = 20 ppm	Sweet chloroform odor – 515 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; suspected human carcinogen
	1,2-Dichloroethylene (acetylene dichloride)	200/200 ppm	None cited	Bitter pungent odor – 0.1 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible CNS damage
	Diethyl phthalate	5/5 mg/mg^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Di-n-butyl phthalate	5/5 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis
	Dieldrin	0.25 mg/m^3	None cited	White odorless crystals	Inhalation; Dermal; Ingestion	Headache; dizziness; nausea; convulsions	Convulsions; suspected carcinogen
	Diesel Fuel	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Possible skin and respiratory irritation; CNS depression	Possible respiratory irritation; dermatitis
	Dicyclopentadiene	5/5 ppm	None cited	Sharp, sweet odor – 0.03 ppm	Inhalation; Dermal	Eye and skin irritation	None cited
	Dioxane	25/(25)	[SKIN]	Ether like odor, eye irritation, headache, nausea – 12 ppm	Inhalation; Dermal	Eye and mucous membrane irritation	Liver and kidney damage
	Denatured Ethanol (85% Ethanol) (Ethyl Alcohol)	1000/1000 ppm	None cited	Sweet alcohol odor – 47 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; dizziness; blurred vision	None cited
	Ethylbenzene	100/100 ppm	STEL = 125 ppm	Aromatic odor – 2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Dermatitis; possible CNS damage.
	Ethylene dibromide (EDB)	0.13 ppm/None cited	NIOSH REL= 0.045 ppm C = 30 ppm NIOSH C = 013 ppm [SKIN]	Mild sweet odor – 10 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Liver and kidney damage; sterilant; suspected human carcinogen; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Gasoline (total petroleum hydrocarbons)	300/300 ppm	STEL = 500 ppm	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis
	Hydrochloric acid (hydrogen chloride or muriatic acid)	5/5 ppm	C = 5 ppm	Irritating pungent odor – 5 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pulmonary edema; eye and skin burns	Dermatitis
	Hydrogen fluoride (hydrofluoric acid or fluorine)	3/3 ppm	STEL = 6 ppm TLV-C = 3 ppm	Strong irritating odor – 0.04 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns; pulmonary edema; cyanosis; delayed fever.	Fluorosis; bronchitis
	Hydrogen peroxide	1/1 ppm	None cited	Sharp irritating odor – 108 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; tremors; convulsions; pulmonary edema. Note: strong oxidizer in concentrated form.	Dermatitis
	Hydrogen sulfide	10/10 ppm	STEL = 15 ppm C = 50 ppm	Rotten egg odor – 0.0005 ppm	Inhalation	Eye and respiratory irritant; chemical asphyxiant; respiratory paralysis; olfactory desensitization	None cited
	Hydraulic oil	None cited	None cited	None cited	Inhalation; Dermal; Ingestion	Possible skin and respiratory irritation; CNS depression	Possible respiratory irritation; dermatitis
	Isopropyl alcohol	400/400 ppm	STEL = 500 ppm	Pleasant odor – 3 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible kidney damage
	Jet fuel	300/300 ppm	STEL = 500 ppm	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis
X	Lead (and inorganic lead	0.05/0.15 mg/m^3	None cited	None cited	Inhalation; Dermal;	GI disturbances; anemia; neuromuscular dysfunction;	GI disturbances; anemia; neuromuscular dysfunction; encephalopathy;

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	compounds and soaps)				Ingestion	encephalopathy	nephropathy; human carcinogen
	Manganese	5/5 mg/m^3 (0.2) (dust) 1/1mg/m^3 (fume)	C = 5 mg/m^3 (dust) STEL = 3 mg/m^3 (fume)	None cited	Inhalation; Ingestion	CNS effects; metal fume fever	Manganese psychosis; muscle weakness; incoordination
	Mercury	0.01/0.05 mg/m^3	C = 0.1 mg/m^3 STEL = 0.03 mg/m^3 [SKIN]	None cited	Inhalation; Dermal; Ingestion	Eye, skin, GI and respiratory irritation; tremors; pneumonitis	Neuromuscular and psychic disturbances; liver and kidney damage; sensitization dermatitis
	Methane	Not applicable (simple asphyxiant)	Not applicable (simple asphyxiant)	None cited	Inhalation	Asphyxiation due to displacement of oxygen; fire and explosion hazard	None cited
	Maleic anhydride	0.25/0.25 ppm	None cited	Acrid odor, double vision, asthma – 0.5 ppm	Inhalation	Severe eye irritation; asthma	Dermatitis
	Methyl ethyl ketone (MEK) (Hexone)	200/200 ppm	STEL = 300 ppm	Sweet acetone odor – 0.25 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible CNS damage
	Methyl isobutylketone (MIBK) (Hexone)	50/50 ppm	STEL = 75 ppm	Sweet sharp odor – 0.1 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and CNS damage; dermatitis
	Methyl methacrylate	100/100 ppm	None cited	Fruity, sulfidy odor, eye irritation – 49 ppb	Inhalation	Eye, skin and mucous membrane irritation	None cited
	Methylene chloride	50/50 ppm	OSHA STEL = 1000 ppm	Sweet odor – 156 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis; suspected human carcinogen
	Mineral spirits (as stoddard solvent)	100/100 ppm	None cited	Kerosene odor	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Dermatitis; possible CNS damage

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Nitrosodimethylamine	None cited	[SKIN]	None cited	Inhalation; Dermal; Ingestion	Eye irritation; CNS effects; nausea; cramps; headaches; fevers	Suspected human carcinogen; damage to liver, kidneys and lungs
	Naphtha (Stoddard Solvent or Petroleum Distillate)	100/100 ppm	None cited	Solventy odor – 0.9 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible kidney damage
	Naphthalene	10/10 ppm	STEL = 15 ppm	Tar odor – 0.3 ppm	Inhalation; Dermal; Ingestion	Eye, skin irritation; headache; nausea; abdominal pain	Damage to liver, kidneys, CNS
	Molybdenum (soluble compounds)	5/5 mg/m^3	None cited	None cited	Inhalation; Ingestion	Headache; fatigue	None cited
	Nickel (metal and insoluble compounds)	1/1 (0.05) mg/m^3	NIOSH REL = 0.015 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pneumonitis	Sensitization dermatitis ("nickel itch"); confirmed human carcinogen
	Nickel (soluble compounds)	0.1/0.1 (0.05) mg/m^3	NIOSH REL = 0.015 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pneumonitis	Sensitization dermatitis ("nickel itch"); confirmed human carcinogen
	Nitric acid	2/2 ppm	STEL = 4 ppm	Acrid, suffocating odor	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; pulmonary edema; pneumonitis; eye and skin burns. Note: strong oxidizer in concentrated form.	Dermatitis
	Perchloroethylene (tetrachloroethylene; tetrachloroethene; or PCE)	25/25 ppm	C = 300 ppm TLV-STEL = 100 ppm	Chlorinated solvent odor – 5 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; skin burns	Liver and kidney damage; peripheral neuropathy; animal carcinogen

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
	Pentachlorophenol	0.5 mg/m^3 (skin)		Benzene-like odor	Inhalation; Dermal; Ingestion	Eye, nose and throat irritation; headache; dizziness; nausea	Chloracne; suspect carcinogen; liver, kidney damage
	Phenol	5/5 ppm	[SKIN] NIOSH REL = 0.001 mg/m^3	Sweet medicinal, odor – 0.05 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns	Possible liver and kidney damage; dermatitis
	Polychlorinated biphenyl 42% chlorine (chlorodiphenyl or PCB)	1/1 mg/m^3	[SKIN] NIOSH REL = 0.001 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin, GI and respiratory irritation; chloracne; liver injury	Liver damage; chloracne; suspected human carcinogen
	Polychlorinated biphenyl 54% chlorine (chlorodiphenyl or PCB)	0.5/0.5mg/m^3	[SKIN]	None cited	Inhalation; Dermal; Ingestion	Eye, skin, GI and respiratory irritation; chloracne; liver injury	Liver damage; chloracne; suspected human carcinogen
	Potassium hydroxide (caustic potash)	2 mg/m^3/None cited	C = 2 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns	Conjunctivitis; dermatitis; lung damage
	Phthalic anhydride	1/1 ppm	None cited	None cited	Inhalation	Eye, skin and respiratory irritation	Asthma; emphysema
	Propylene glycol	100/100 ppm	STEL = 150 ppm	Objectionable odor – 100 ppm	Inhalation	Nose, eye and throat irritation	None cited
	Silica (respirable quartz)	0.1/0.1 mg/m^3	NIOSH REL = 0.05 mg/m^3	None cited	Inhalation	Dyspnea; fever; cough; weight loss	Silicosis and respiratory illness
	Silver (metal and soluble compounds)	0.01/0.01 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; argyria of eyes, skin and mucous membrane	Argyria of eyes, skin and mucous membranes
	Sodium hydroxide (caustic soda)	2 mg/m^3 /None cited	C = 2 mg/m^3	None cited	Inhalation; Dermal;	Eye, skin and respiratory irritation; skin and eye burns;	Conjunctivitis; dermatitis; lung damage

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
					Ingestion	pneumonitis	
	Strontium-90	None cited	1.25 REM/qtr	None cited	Inhalation; Dermal	Anemia; infection; GI disturbances	Cancer; neoplasia of bone; osteosarcoma; fibro sarcomi; leukemia
	Styrene	50/50 (20) ppm	STEL = 100 (40) C = 500 [SKIN]	Solventy odor, eye irritation – 0.15 ppm	Inhalation; Dermal	Eye and mucous membrane irritation; CNS depression	Dermatitis
	Sulfuric acid	1/1 mg/m^3	STEL = 3 mg/m^3	Irritating odor – 1 mg/m^3	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; skin and eye burns; pulmonary edema	Lung damage; dermatitis; dental erosion
	1,1,2,2-Tetrachloroethane (freon 112)	1/1 ppm	[SKIN]	Pungent, chloroform-like, sickly, sweet odor – 2.5 ppm	Inhalation; Dermal; Ingestion	Skin, GI and respiratory irritation; CNS depression; nausea	Liver damage; dermatitis; CNS effects; suspected human carcinogen
	Tetrethyl lead	0.075/0.1 mg/m^3	[SKIN]	Pleasant, sweet odor	Inhalation; Dermal; Ingestion	CNS depression; convulsions; bradycardia; eye irritation	CNS and peripheral nervous system damage; psychosis; kidney damage
	Tin (tin and inorganic compounds)	2/2 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; neurological disturbances	Stenosis; dermatitis
	Toluene	100/50 ppm	STEL = 150 ppm C = 500 ppm [SKIN]	Rubbery, mothball odor – 2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver, kidney and CNS damage; dermatitis
	1,1,1-Trichloroethane (methyl chloroform; or TCA)	350/350 ppm	STEL = 450 ppm C = 800 ppm NIOSH C = 350 ppm	Chloroform odor – 102 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; cardiac arrhythmia	Possible liver, CNS and CVS damage; dermatitis
	1,1,2-Trichloroethane	10/10 ppm	[SKIN]	None cited	Inhalation; Dermal;	Eye, skin and respiratory irritation; CNS depression	Possible liver, kidney and CNS damage; suspected human carcinogen; dermatitis

Expected at This Site	Chemical Name* (or class)	PEL/TLV*	Other Pertinent Limits* (Specify)	Warning Properties – Odor Threshold	Potential Exposure Pathways	Acute Health Effects	Chronic Health Effects
					Ingestion		
	Trichloro-trifluoroethane (freon113)	1000/1000 ppm	STEL = 1250 ppm C = 2000 ppm	Sweet odor – 45 ppm	Inhalation; Dermal; Ingestion	Eye and respiratory irritation; CNS depression; cardiac arrhythmia	Dermatitis; possible heart problems
	Trichloroethylene (TCE)	25/50 ppm	STEL = 200 ppm C = 300 ppm TLV-STEL = 100 ppm	Sweet, solventy odor – 0.2 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression; headache; tremors; nausea; cardiac arrhythmia	Possible liver, kidney, cardiovascular, GI and CNS injury; suspected human carcinogen
	Tritium	None cited	1.25 REM/qtr	None cited	Inhalation; Dermal	Anemia; infection	Cancer
	Uranium (natural insoluble compounds)	0.05/0.2 mg/m^3	TLV-STEL = 0.6 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Respiratory and dermal irritation	Bone marrow depression; damage to lymphatic system; suspect carcinogen
	Uranium (natural soluble compounds)	0.2/0.2 mg/m^3	STEL = 0.6 mg/m^3	None cited	Inhalation; Dermal; Ingestion	Respiratory and dermal irritation	Pulmonary and renal damage; bone marrow depression; damage to lymphatic system; suspect carcinogen
	Vinyl chloride	1/5 ppm	[SKIN] 15-min STEL = 5 ppm	Pleasant odor	Inhalation; Dermal; Ingestion	CNS depression; weakness; abdominal pain	Damage to lymphatic system; liver cancer; Reynauds Syndrome; vascular disturbances; confirmed human carcinogen
	Zinc Oxide dust	10/10 mg/m^3	None cited	None cited	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation	Respiratory irritation; dermatitis
	Xylene	100/100 ppm	STEL = 150 ppm C = 300 ppm	Sweet odor – 0.1 ppm	Inhalation; Dermal; Ingestion	Eye, skin and respiratory irritation; CNS depression	Possible liver and kidney damage; dermatitis; damage to CNS

PEL	=	OSHA Permissible Exposure Limit; represents the maximum allowable 8-hr. time weighted average (TWA) exposure concentration.
TLV	=	ACGIH Threshold Limit Value; represents the maximum recommended 8-hr. TWA exposure concentration.
STEL	=	OSHA Short-term Exposure Limit; represents the maximum allowable 15 minute TWA exposure concentration.
TLV-STEL	=	ACGIH Short-term Exposure Limit; represents the maximum recommended 15 minute TWA exposure concentration.
C	=	OSHA Ceiling Limit; represents the maximum exposure concentration above which an employee shall not be exposed during any period without respiratory protection.
IDLH	=	Immediately Dangerous to Life and Health; represents the concentration at which one could be exposed for 30 minutes without experiencing escape-impairing or irreversible health effects.
( )	=	ACGIH TLV Intended Change
[SKIN]	=	Indicates a significant contribution of the total exposure by the cutaneous route.
Warning	=	Represents the lowest concentration detectable in a given population. However, detection varies greatly with the individual.
REL	=	NIOSH Recommended Exposure Limit, based on a 10-hour TWA exposure

3.2 Physical Hazards

This section discusses physical hazards that may be encountered in the work environment during this project. Each or the job classifications described in Section 3.0 may be potentially exposed to one or more of these hazards. A brief description of each hazard and the appropriate personal protective equipment or control devices that should be used to prevent injury are described. The potential hazards described below are not necessarily found at each site, however, they are common to most sites.

3.2.1 Head Protection

Hard hats (ANSI-approved) are to be worn during all field activities.

3.2.2 Eye/Face Protection

Impact resistant safety glasses shall be worn as necessary to protect against airborne particles or projectiles. In addition, safety glasses shall be worn at all times at facility that require such (refinery, chemical plants, etc.). Appropriately shaded lenses shall be worn to protect against damaging rays such as those encountered during welding. If appropriate, safety goggles and face shields may be required at locations where splashing liquids may be encountered.

3.2.3 Foot Protection

Work boots with a steel reinforced toe shall be worn during all field activity. Steel reinforce shanks may be required in special situations where protection of the bottom of the foot is a concern.

3.2.4 Personal Protective Clothing

All personnel involved in field activities at the site shall wear long pants, shirt, steel toe boots, hardhats, and eye protection (when necessary).

3.2.5 Heavy Equipment Operation

EEC employees and their subcontractors must be aware of the dangers associated with heavy equipment and other vehicles onsite. These equipment and vehicles may include but are not limited to drill rigs, backhoes, loaders, and excavators. Due to the nature of these equipment, the operators vision may be compromised, therefore, all on-site personnel including the equipment operators must exercise caution. Only those individuals trained and certified in the safe operation of heavy equipment are authorized to operate such equipment.

Potential hazards are also present during the loading and unloading of such items as rolloff bins, backhoes, and loaders. These hazards include pinch and crush type injuries that can be sustained if a person is struck, pinched or pinned while the items are unloaded, or if the items break loose during unloading.

3.2.6 Equipment Failure

All equipment used onsite is to be good working order before being used onsite. Equipment is to be inspected and tested before use. The use of malfunctioning equipment is prohibited. Any malfunctioning equipment is to be tagged until repaired.

3.2.7 Underground / Aboveground Utility Lines

Forty-eight hours prior to initiation of site activity Underground Services Alert [(800) 422-4133] will be contacted prior to subsurface excavation or drilling. Additional subsurface line locating may also be required (i.e. ground penetrating radar) if site conditions warrant.

The Field Team Leader is to observe all overhead utility line locations, and inform all personnel whose equipment or vehicles may come in close proximity to these lines. Drill rigs, other vehicles, and equipment must remain a minimum of 10 feet from these utility lines. If humid conditions exist this distance may be extended.

3.2.8 Excavation / Trenching

Excavation, trenching and other earthwork shall be performed in accordance with the regulations defined in California Code of Regulations, Title 8, Article 6 of the Construction Safety Orders.

3.2.9 Confined Space Entry

All confined spaces such as tanks, trenches, and excavations are considered a confined space. Confined space will be entered only following the protocols identified in the Cal-OSHA Title 8 CCR Sections 5156-5159.

3.2.10 Protection from Moving Machinery / Parts

EEC personnel and their subcontractors will secure loose clothing, jewelry, and long hair to prevent entanglement. All unused machinery or equipment capable of movement shall be stopped and/or de-energized to prevent inadvertent movement or shock during storage, cleaning, or servicing.

3.2.11 Slips, Trips, and Falls

All employees should be aware of water, oil, machinery, mud and tools that may be present throughout the site that pose a potential slip, trip and fall hazard. All employees should assist in minimizing this potential by using good housekeeping procedures. Walkways, working areas, and roadways should be kept clear of all non-essential tools, machinery and supplies.

3.2.12 Back Injury

All employees should be extremely cautious when lifting or handling heavy materials. Back supports and proper lifting techniques should be utilized whenever possible.

3.2.13 Fire

Smoking is prohibited at all sites, unless a designated smoking area has been established. Smoking and hot work procedures are prohibited during fueling operations including those involving portable equipment. Hot work will not be performed in a potentially explosive environments until approval has been granted and a combustible gas indicator has indicated that the atmosphere is appropriate. Instrumentation used in potentially flammable locations must be rated intrinsically safe for Class I atmosphere.

3.2.14 Power Tools

All power tools must be in good working conditions prior to being used onsite. Safety glasses with side shields are required to prevent possible impact by airborne particulate and projectiles. Electrical equipment should be plugged in to ground fault interrupt (GFI) circuits whenever possible. Care should be exercise in wet environments and if equipment or extension cords become faulty. Failure to do so may result in electrocution. Any damaged or defective extension cords are to be discarded.

3.2.15 Noise

EEC employees and their subcontractors are required to carry hearing protection at all times. Hearing protection is to be worn when working in close proximity to heavy equipment or other sources of potentially damaging noise.

3.2.16 Heat Stress

At elevated temperatures or when workers are wearing personal protective equipment the potential for heat stress increases. Symptoms of heat stress are heat rashes, heat cramps, heat exhaustion and heat stoke. Early recognition of these symptoms can prevent serious illness. The following are characteristics and treatment of each illness:

Heat Rashes
Symptom: Characterized by localized red skin rash (small red pimples) and reduced sweating.
Treatment: Clean skin and let dry thoroughly after removing protective equipment.

Heat Cramps
Symptom: Characterized by muscle spasms and pain in the extremities and abdomen;
Heat exhaustion: characterized by a weak pulse; shallow breathing; pale, cool, moist skin; profuse sweating; dizziness; and fatigue.

Treatment: Rest in a cool location; provide victim sips of salted water (one teaspoon of salt in one quart of water), Gatorade©, or other electrolyte replacement fluid;

Heat Stroke

Symptom: Characterized by red, hot, dry skin; body temperature of 105°F or greater; no perspiration; nausea; dizziness and confusion; strong rapid pulse; coma; and death.

Treatment: Obtain emergency medical aid. While waiting for aid, remove as much clothing as possible, wrap victim in water soaked towels or immerse in water; apply cold packs under arms, around neck. Once victims temperature is below 102°F discontinue water immersion.

3.2.18 Sunburn

Exposure to sunlight for prolonged periods of time may cause sunburn to some individuals. All field personnel should carry sunblock with a sun protection factor (SPF) of 15 or greater, and use when appropriate.

3.2.19 Bloodborne Pathogens

Personnel administering first aid or CPR should avoid contact with blood or other potentially infectious fluids. Latex gloves and CPR mouth-to-mouth isolation devices should be utilized whenever possible.

3.2.20 Marine Safety

When performing ocean sampling all personal should be equipped with coast guard approve Personnel Floatation Devices (PFDs). Field personal should always be aware of tides, local currents and harmful sea life. Ocean sampling should always be performed by a team of two or more persons, individual sampling should never be performed. For prolonged period of ocean sampling, a wet suit should be used to reduce the risk of hypothermia.

4.0 TRAINING REQUIREMENTS

All EEC personnel and their subcontractors (except those with temporary, short-term, and sporadic visits, i.e. delivery personnel) are required to have completed all applicable training requirements as specified in Cal-OSHA Hazardous Waste and Operations (HAZWOPER) standard in Title 8, California Code of Regulations, Title 5192 and the Federal HAZWOPER) standards in the Code of Federal Regulations, Title 29, Part 1910.120.

All EEC personnel and their subcontractors (except those exempt above) will attend a project-specific training meeting for safety issues and review the project tasks before beginning work. The discussion will review the contents of the SHSP, allow all personnel to review the plan, and will require all personnel to sign the plan verifying their participation in the meeting. The meeting will be led by the Field Team Leader or Project Manager. If respirators are to be used or are anticipated to be needed during the course of the work, then fit testing of personnel may also be included in the meeting.

5.0 PERSONAL PROTECTIVE EQUIPMENT

Personal Protective Equipment (PPE) is designed to shield or isolate individuals from the chemical, physical, radiological and biological hazards that may be encountered at a hazardous waste site. PPE should be used in conjunction with, not in place of, other protective methods, such as engineering controls and safe work practices. The use of PPE itself can create significant worker hazards, such as heat stress, physical and psychological stress, impaired vision, reduced mobility, and distorted communications. For any given situation, PPE should be selected to provide an adequate level of protection. Over-protection as well as under protection can be hazardous and should be avoided.

Protective equipment is selected based on the contaminant(s) type, concentration(s) in air, water, soil, or other matrix, and known routes of entry into the human body. In situations were the type of materials, their concentrations, or exposure potential are unknown, a subjective decision regarding the assignment of PPE will be made by the HSO or Project Manager.

The U.S. EPA levels of protection are:

Level A: Worn when the highest level of respiratory, skin and eye protection is needed.

Level B: Worn when the highest level of respiratory protection is needed, but a lesser level of skin protection is needed.

Level C: Worn when the criteria for using a air-purifying respirator are met, and a lesser level of skin protection is needed.

Level D: Refers to work conducted without respiratory protection. This level should be used only when the atmosphere contains no known or suspected airborne chemical or radiological contaminants and oxygen concentrations are between 19.5% and 23%.

Level A and B PPE will not be utilized on this project at this time. If conditions warrant upgrading to Level A or B, this SHSP will be revised.

Based on available information and experience at similar sites, respiratory protection is not anticipated. Therefore the following protocols will be in effect:

1) Level D Personal Protective Equipment (in exclusion zone)
   - Hard Hat
   - Safety Glasses
   - Steel-toed boots
   - Nitrile gloves (inner)
   - Nitrile glove (outer)

2) All employees and subcontractors who have the potential for direct skin contact will be required to wear appropriate skin protection (tyvek, coveralls, nitrile gloves, etc.)

3) All workers exposed to load noises or whose predicted 8-hour time-weighted average exposure to noise equals or exceeds 85 dBA shall be provided with and wear hearing protection.

4) All workers shall be prepared to upgrade to levels C PPE. All personnel should maintain their own Level C PPE.

5.1 Level C Personal Protective Equipment

Level C PPE shall include:

- Boots or work shoes with steel toe (and shank if deemed necessary)
- Boots (neoprene with steel toe (and shank if necessary), if high direct contact exposure exists)
- Protective inner gloves (surgical nitrile, if high direct exposure exits)
- Protective outer gloves (nitrile, if high direct exposure exists)
- Protective outer gloves (leather permissible if high direct exposure does not exist)
- Coveralls, inner (fire retardant), if required
- Coveralls, outer (polyethylene-coated spunbonded polyolefin, Tyvek, or similar, if high direct contact potential exists)
- Hard hat
- Half-mask air-purifying respiratory protection with NIOSH/MSHA approved cartridges (organic vapor/HEPA, as necessary:
- Traffic vest (as necessary)

5.2 Level D Personal Protective Equipment

Level D PPE shall include:

- Boots or work shoes with steel toe (and shank if deemed necessary)
- Boots (neoprene with steel toe (and shank if necessary), if high direct contact exposure exists)
- Protective inner gloves (surgical nitrile, if high direct exposure exits)
- Protective outer gloves (nitrile, if high direct exposure exists)
- Protective outer gloves (leather permissible if high direct exposure does not exist)
- Coveralls, inner (fire retardant), if required
- Coveralls, outer (polyethylene-coated spunbonded polyolefin, Tyvek, or similar, if high direct contact potential exists)
- Hard hat
- Traffic vest (as necessary)

6.0 MEDICAL SURVEILLANCE

The medical surveillance program is a regulatory requirement designed to ensure that the health or employees working on hazardous or potentially hazardous sites is, at a minimum, monitored and documented before, during, and at the termination of work at the site. The medical surveillance requirements conform with the specifications in Title 8, California Code of Regulations, Titles 5216 and 5192; and in the Code of Federal Regulations , Title 29, Part 1910.120.

All EEC employees and their subcontractors engaged in potential hazardous waste operations must complete a preplacement or annual medical examination which includes a complete medical and occupational history, physical examination and biological monitoring. Only the employee and the HSO will have access to the medical records.

Medical surveillance will be required at the following intervals:

- Baseline or pre-placement examination
- Periodic monitoring (annual)
- Examination after illness or injury
- Termination

Medical surveillance programs are designed to provide the following information:

- Establish the baseline medical condition of employees and fitness for work
- Determine the ability to work while using protective equipment
- Track the physiological condition of employee
- Track pertinent details regarding the baseline, periodic, after-injury, and termination examinations

At a minimum the medical surveillance program will consist of:

- Complete medical and work history
- Physical examination
- Pulmonary function test
- Chest X-ray
- Eye examination
- EKG
- Audiogram
- Urinalysis
- Blood chemistry (complete blood count)
- Heavy metal screen (as appropriate)

7.0 GENERAL PROJECT SAFETY REQUIREMENTS

Project activities will be conducted in accordance with the following minimum safety requirements:

- The work area will be restricted to authorized visitors and personnel. These individual are required to attend a tailgate safety meeting prior to entering the work area. The tailgate safety meeting will discuss general project safety requirements, personal protective requirements, anticipated contaminants, and emergency response procedures. Tailgate safety meetings will be held daily, at the beginning of the work day, and attendance will be recorded. All authorized personnel must have completed HAZWOPER training.

- All personnel entering the site must check in with the Project Manager or Field Team Leader.

- Eating, drinking, chewing, and the application of makeup is restricted to the Support Zone.

- All skin contact with contaminated or potentially contaminated material or equipment should be avoided.

- Personnel should use the "Buddy System" when performing site duties. Communication should be established and maintained between team members at all times.

- All personnel entering the exclusion zone shall wear the appropriate personal protective equipment.

- A fire extinguisher shall be available for use at all times. Travel distance between fire extinguisher shall not be greater than 50 feet at any time.

- A portable eyewash station or bottle should be available onsite at all times.

- A first aid kit shall be located onsite at all times.

- During excavation or drilling, contaminated soil should be contained in drums, roll-off bins or placed on plastic lining.

- Shaking or blowing potentially contaminated clothing or equipment to remove dust or other material is prohibited.

- A warning sign which complies with the Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) shall be posted at the entrances of all work areas where one or more substances which are known by the State of California to cause cancer or reproductive harm are known or suspected to exist. That warning sign shall state:

  WARNING: This area contains a chemical known to the State of California to cause cancer or reproductive harm.

- All hazardous wastes removed from the site will be properly labeled and accompanied by appropriate papers in accordance with local, state and federal guidelines.

8.0 EXPOSURE MONITORING / AIR SAMPLING

Based on available information and experience at similar sites, it is not expected that project personnel will be exposed to substances at concentrations exceeding the PEL's or TLV's. However, all EEC personnel and their subcontractors will be dressed in Level D personnel protective equipment at a minimum, and will have Level C supplies with them at the job site at all times. The work area will be monitored using a direct-reading flame-ionization detector (FID), photo-ionization detector (PID), or direct reading combustible gas meter to detect the concentrations of volatile hydrocarbons in the ambient atmosphere. If appropriate, other methods of may be used to identify contaminants and their concentration. These methods included Drager (or equivalent) tubes, portable gas chromatographs, particulate monitoring devices, or personal sampling pumps with appropriate sampling canisters.

If the lowest TLV or PEL is encountered in the breathing zone, then appropriate personal protective equipment must be worn. Half-face respirators offer a protection factor of ten, full-face respirators offer a protection factor of 50. If concentrations exceeding 50 times the PEL or TLV are encountered, all personnel must immediately leave the site.

Direct reading instruments such as the FID or PID will be used at all sites, at regularly scheduled intervals to determine the airborne concentrations of organic compounds. The FID is generally capable of measuring airborne concentrations of many organic vapors between 0.1 and 1,000 parts per million (ppm). The PID is capable of detecting many organic vapors between 1 and 2,000 ppm. At a minimum, air monitoring will be recorded at the excavation edge and in the breathing zone. Readings will generally be recorded at 15 minute intervals during excavation of contaminated soil.

9.0 SITE CONTROL

The site control program is used to control movement of people and equipment in order to minimize worker exposure to hazardous substances or conditions. Essential to this program is the development of work zones. These work zones shall include: 1) Exclusion zone; 2) Contamination Reduction Zone; and 3) Support Zone. The work zones should be clearly identified with safety cones, flags, barrier tap or signs.

The Exclusion Zone will generally be the area immediately surrounding an excavation or drill rig. This is an area where there is a strong likelihood that contaminants will be encountered. Only essential personnel will be allowed into the Exclusion Zone. Any personnel not wearing appropriate personal protective equipment and without appropriate HAZWOPER training will not be allowed in the Exclusion or Contaminant Reduction zones.

The Contamination Reduction Zone is generally an area at one end of the Exclusion Zone where appropriate decontamination of personal protective equipment (PPE) and equipment can take place and where disposable PPE can be deposited. Where practical approximately 25-75 feet of space surrounding the Exclusion Zone will be designated as the Contamination Reduction Zone.

The Support Zone will be located outside the Contamination Reduction Zone. A rest area may be located within the Support Zone.

If the safety of the public (motorist, pedestrian, etc.) may be endangered, all work will be immediately stopped until the situation is remedied. Cones, caution tape, or warning signs will be used when necessary to redirect pedestrian or motor traffic.

10.0 DECONTAMINATION

To prevent or reduce the transfer of contaminants by people and/or equipment leaving the Exclusion Zone, decontamination measures will be implemented. These decontamination measures include:

- Dispose of boot covers, or use a brush to remove all foreign material from boots;
- Remove outer gloves, dispose or wash gloves;
- Remove protective clothing, dispose if appropriate;
- Wash respirator bodies in warm water, dispose of cartridges;
- Remove inner gloves, wash hands and face thoroughly with soap and water, remove work clothes and shower as soon as possible;
- Brush or wash all equipment that was within the exclusion zone;
- Dispose of all decontamination equipment (brushes, sponges, etc.) and disposal personal protective gear into an appropriate container.

11.0 EMERGENCY RESPONSE / CONTINGENCY PLANS

All personnel will be trained in the proper response to emergency response / contingency plans. In the event of a fire, explosion or other emergency condition requiring evacuation, all employees will proceed to the nearest upwind collection area. Decontamination procedures will be abandoned in the case of evacuation. The project manager, field team leader, or any other field personnel shall contact the appropriate fire or response agency. After emergency response personnel are contacted, the field personnel shall also contact EEC management and the pertinent client contact. Phone numbers of appropriate emergency response personnel, EEC management, and client contact are shown on the following page.

In the event that a worker must be transported to a hospital or other medical facility, the Project Manager, Field Team Leader or other appropriate personnel shall ensure that the chemical contaminant information is provided to the medical facility personnel (if pertinent to the injury). The emergency care facility located closest to the site is discussed on the following page.

Emergency and non-emergency accidents/injuries will be documented by the Project Manager or other management personnel in accordance with applicable rules and regulations.

11.1 General First Aid Guidelines

The following is general guidelines to follow in the event of an accident or injury.

Inhalation Exposure:	Remove victim to fresh air, give rescue breathing or CPR as necessary. Decontaminate and transport to emergency hospital if necessary.
Skin/Eye Contact:	Remove contaminated clothing, flush affected area with copious amounts of water for at least 15 minutes; if eyes are affected, hold eyelids open to assure adequate flushing. Decontaminate and transport to emergency hospital, if necessary.
Ingestion:	Decontaminate and transport to emergency hospital
Puncture/Laceration:	Decontaminate and transport to emergency hospital

11.2 Emergency Hospital Directions (attached map, Appendix B)

Emergency Hospital Directions	
Hospital:	Arrowhead Regional Medical Center (~ 2.72 miles, 6 minutes) from the Site)
Phone Number:	(909) 580-1000
Address:	400 North Pepper Avenue, Colton, California 92324
Directions:	1. From the site, head north on Congress Street (towards South 8th Street); 2. Turn RIGHT on South 8th Street (0.29 miles); 3. Turn LEFT on East O Street (59 feet); 4. Turn RIGHT on South 8th Street (335 feet); 5. Bear RIGHT on South La Cadena Drive (0.38 miles); 6. Turn LEFT to take ramp onto I-10 WEST towards Los Angeles (1.44 miles); 7. Take exite #69/Pepper Avenue (0.23 miles); 8. Turn RIGHT on North pepper Avenue (0.17 miles); and 9. Arrive at Arrowhead Regional Medical Center on RIGHT.

11.3 Emergency Telephone Numbers

EMERGENCY TELEPHONE NUMBERS	
Arrowhead Regional Medical Center	**(909) 580-1000**
Ambulance/Paramedics/Fire Department	**911**
Police	**911**
Poison Control Center	**1-(800) 876-4766**
National Response Center	**(800) 424-8802**
Chemical Transportation Emergency Center Chemtrec (24 hours)	**(800) 424-9300**
EEC - Mark Zeko **(pager)** **(mobile)**	**(714) 667-2303** **(714) 358-9249** **(714) 814-2174**
EEC - John Shaffer **(pager)** **(mobile)**	**(714) 667-2302** **(714) 358-9248** **(714) 814-2173**
Occupational Safety and Health Admin. (OSHA)	**(213) 861-9993**

12.0 RECORD KEEPING

Records shall be kept in accordance with all Federal and State guidelines. The following records for EEC employees will be maintained at the office:

- Hazard Communication and Hazardous Waste Site Training
- Respiratory Protection Training (and annual fit testing certificate)
- Respirator Assignment
- Medical Surveillance
- Site Safety Inspections
- Personal Monitoring Records (if applicable)
- Accident and OSHA Logs

The following records will be maintained at the site (if appropriate):

- Site Entry Log/ Visitor Log
- Worker illness/injury reports
- Work Plan
- Site Health and Safety Plan
- Site Safety Inspection Reports
- Sampling activities
- Daily Field Reports
- Chain of Custody forms
- Tailgate Safety Meeting Forms

EEC's subcontractors will be responsible for maintaining their employee records in a manner consistent with the applicable regulations.

13.0 SHSP IMPLEMENTATION AND SIGNATURE PAGE

The following EEC personnel have reviewed this Site Health and Safety Plan:

Title	Name	Signature	Date
Health and Safety Officer	Mark Zeko		
Project Manager	Dave Bernier		
Field Team Leader			
Team Members			
Subcontractors			

APPENDIX A
PEL/TLV DEFINITIONS

Permissible Exposure Limits

Permissible Exposure Limit (PEL) is a persons permitted exposure to any material listed in Table Z-1, Z-2, or Z-3 of OSHA Regulations found in 29 CFR 1910.1000, Air Contaminants and in the State of California Department of Industrial Relations, Division of Occupational Safety and Health (Cal-OSHA), in California Code of Regulations (CCR), Title 8, General Industry Safety Orders, Section 5155 and other sections. If PEL's for a compound differ between state and federal requirements, the more stringent requirement is utilized. PEL's generally represent time-weighted average values based on a 8-hour work day, 40 hours per week. Another commonly used exposure limit is the Short Term Exposure Limit (STEL) values which, generally, represent limits not to be exceeded for time periods longer than 15 minutes. Some substances have also been assigned a ceiling limit © which is a value not to be exceeded at any time during a work shift. Exposure to certain substances can be enhanced by contact with skin, mucous membranes and/or eye contact. These substances are designated with the notation "Skin".

Threshold Limit Value / Time-Weighted Average (TLV-TWA)

The time-weighted average concentration of a airborne substance over a normal 8-hour workday and a 40-hour workweek to which nearly all workers may be repeatedly exposed, day after day, for a 40 year working lifetime without adverse affects. The TLVs listed in this SHSP are recommended by the American Conference of Governmental Industrial Hygienists (ACGIH). TLVs are based on the available information, from industrial experience, human and animal studies, and when possible a combination of the three sources. TLV's are generally expressed as 8-hour time-weighted averages (TLV-TWA). However they can also be expressed as short term exposure limits (TLV-STEL), ceiling values (TLV-C), and have carry special notations regarding enhanced exposure do to contact with skin.

FINAL ENVIRONMENTAL IMPACT REPORT (EIR) FOR SOIL SAFE LAND IMPROVEMENT PROJECT, CITY OF COLTON, SAN BERNARDINO COUNTY

Dear Mr. Tomich:

We have reviewed the Final EIR document dated February 24, 2011 for the Soil Safe Landfill Improvement Project, which we received on February 25, 2011. The proposed project includes grading and filling a 29-acre site with non-hazardous treated soils in order to raise the site's elevation above the flood plain of the Santa Ana River. The treatment process consists of mixing non-hazardous soils with Portland cement to physically fix any potential contaminates. The site is located southwest of the intersection of Interstates 10 and 215 in the City of Colton. The engineered soil will consist of imported soil meeting self-imposed quality limits, which are set at or below all regulatory thresholds and will be modified on site by processing with Portland cement. The modified soil will then be placed and compacted over the entire site. Potential projects to be developed on the raised site may include 400,000 square feet of light industrial use, the extension of Fogg Street, and the realignment of the Union Pacific rail line.

Based on our review of the Final EIR, Board staff finds that the proposed project should not pose a threat to water quality or the environment provided that the project meets all Applicable or Relevant and Appropriate Requirements (ARAR) and regulatory thresholds for soil placement at the project site, especially the requirements for total lead, copper, and nickel concentrations, as amended by Section 25157.8 (a) of the Public Health and Safety Code, which prohibits the disposal of waste containing total lead in excess of 350 parts per million (ppm), copper in excess of 2500 ppm, and nickel in excess of 2000 ppm to any location other than a Class I hazardous waste site. The project proponents shall ensure that soil disposed of at the site is consistent with the above-referenced Health and Safety Code.

If you have any questions regarding this letter, please do not hesitate to contact me at (951) 782-4997.

Sincerely,

Keith Person

CITY OF COLTON
Development Services Department
Memorandum

Date: September 6, 2012

To: Rod Foster, City Manager

From: Mark Tomich, Development Services Director

Subject: Guyaux Landfill Update

This is to update you, the Mayor and Council Members on our research regarding efforts to address contamination issues at the Guyaux Landfill.

Landownership Issues

Staff has talked with the (former) property owner, Mike Griffin, in the attempt to secure his cooperation in the landfill cleanup. We have also inquired about his willingness to donate the property to the City. Although Mr. Griffin has indicated his willingness to cooperate on clean-up activities, he would want to include the Riverside Utility in any clean-up discussions. For City- or grant-funded clean-up to occur, a cooperative agreement would need to be negotiated between the landowner and the City. Mr. Griffin is not interested in donating the property to the City, but is willing to negotiate a sale of the property, assuming that he still has control of the property.

Any movement toward negotiating a cooperative agreement for cleanup of the property or purchase of the property is complicated by the fact that the property is in receivership. At this stage, the bank and other creditors have not reached the stage where they can enter into any cooperative agreement or sell the property. We are continuing to monitor the receivership process and provide an update when title to the property is no longer clouded.

Level of Contamination and Health Risk

Based on my discussions with Santa Ana Region Water Quality Control Board staff, and comments from two environmental engineers who have reviewed existing studies, there is minimal health risk to nearby residents from exposure to the landfill. However, there is a possibility of long-term impacts on groundwater quality from continued leaching of rain/runoff through the landfill.

Soils studies conducted in 1997 (to a depth of 6-inches to 1-foot), determined that levels of lead exceeded federal standards at several “hot spots.” However, limited soils testing conducted by Soil Safe in 2010 did not find lead levels that meet hazardous thresholds. Soil Safe also installed five groundwater testing wells at the landfill. The wells found some traces of volatile organic compounds (VOC), but not at hazardous levels, and no discernable impacts on

groundwater. However, electrical conductivity tests (a means to determine elevated levels of salts) concluded that salts slightly exceed federal drinking water standards.

Santa Ana Region Water Quality Control Board staff has informed me that, although they would like to see the landfill capped, they would not take any action to force the City (or landowner) to cap the site unless contamination leaks into the Santa Ana Groundwater Basin. The local enforcement agency (LEA) is the San Bernardino County Health Department/Environmental Health.

Actions to Address Contamination

Water Board staff recommends the following remedial actions:

1. Conduct review of existing studies/documentation regarding Guyaux Landfill.
2. Investigate soils "hot spots" (identified in 1997 study) to determine current contamination levels. If any hot spots continue to exist, prepare a remediation ("hot spot removal") plan.
3. Design and install drainage improvements to move runoff around the landfill.
4. Cover landfill (preferred) with topsoil or other cover. This will minimize water infiltration and improve drainage.

I have also contacted two environmental engineering firms (SWT Engineering and BAS Associates) for their informal assessment of what remediation activities need to occur, including the range of costs. The range of costs includes the following:

- Review of existing documentation/studies: Approximately $10,000
- Onsite soils testing and wells, if necessary: $20,000 to $40,000
- Hot spot removal: $25,000 to $50,000
  Note: Both firms recommended "cap in place" rather than removal of hot spots.
- Soil cover (1-foot depth, 4 acres): $170,000 to $200,000 (including importing of soil)
- Drainage: $15,000 to $30,000

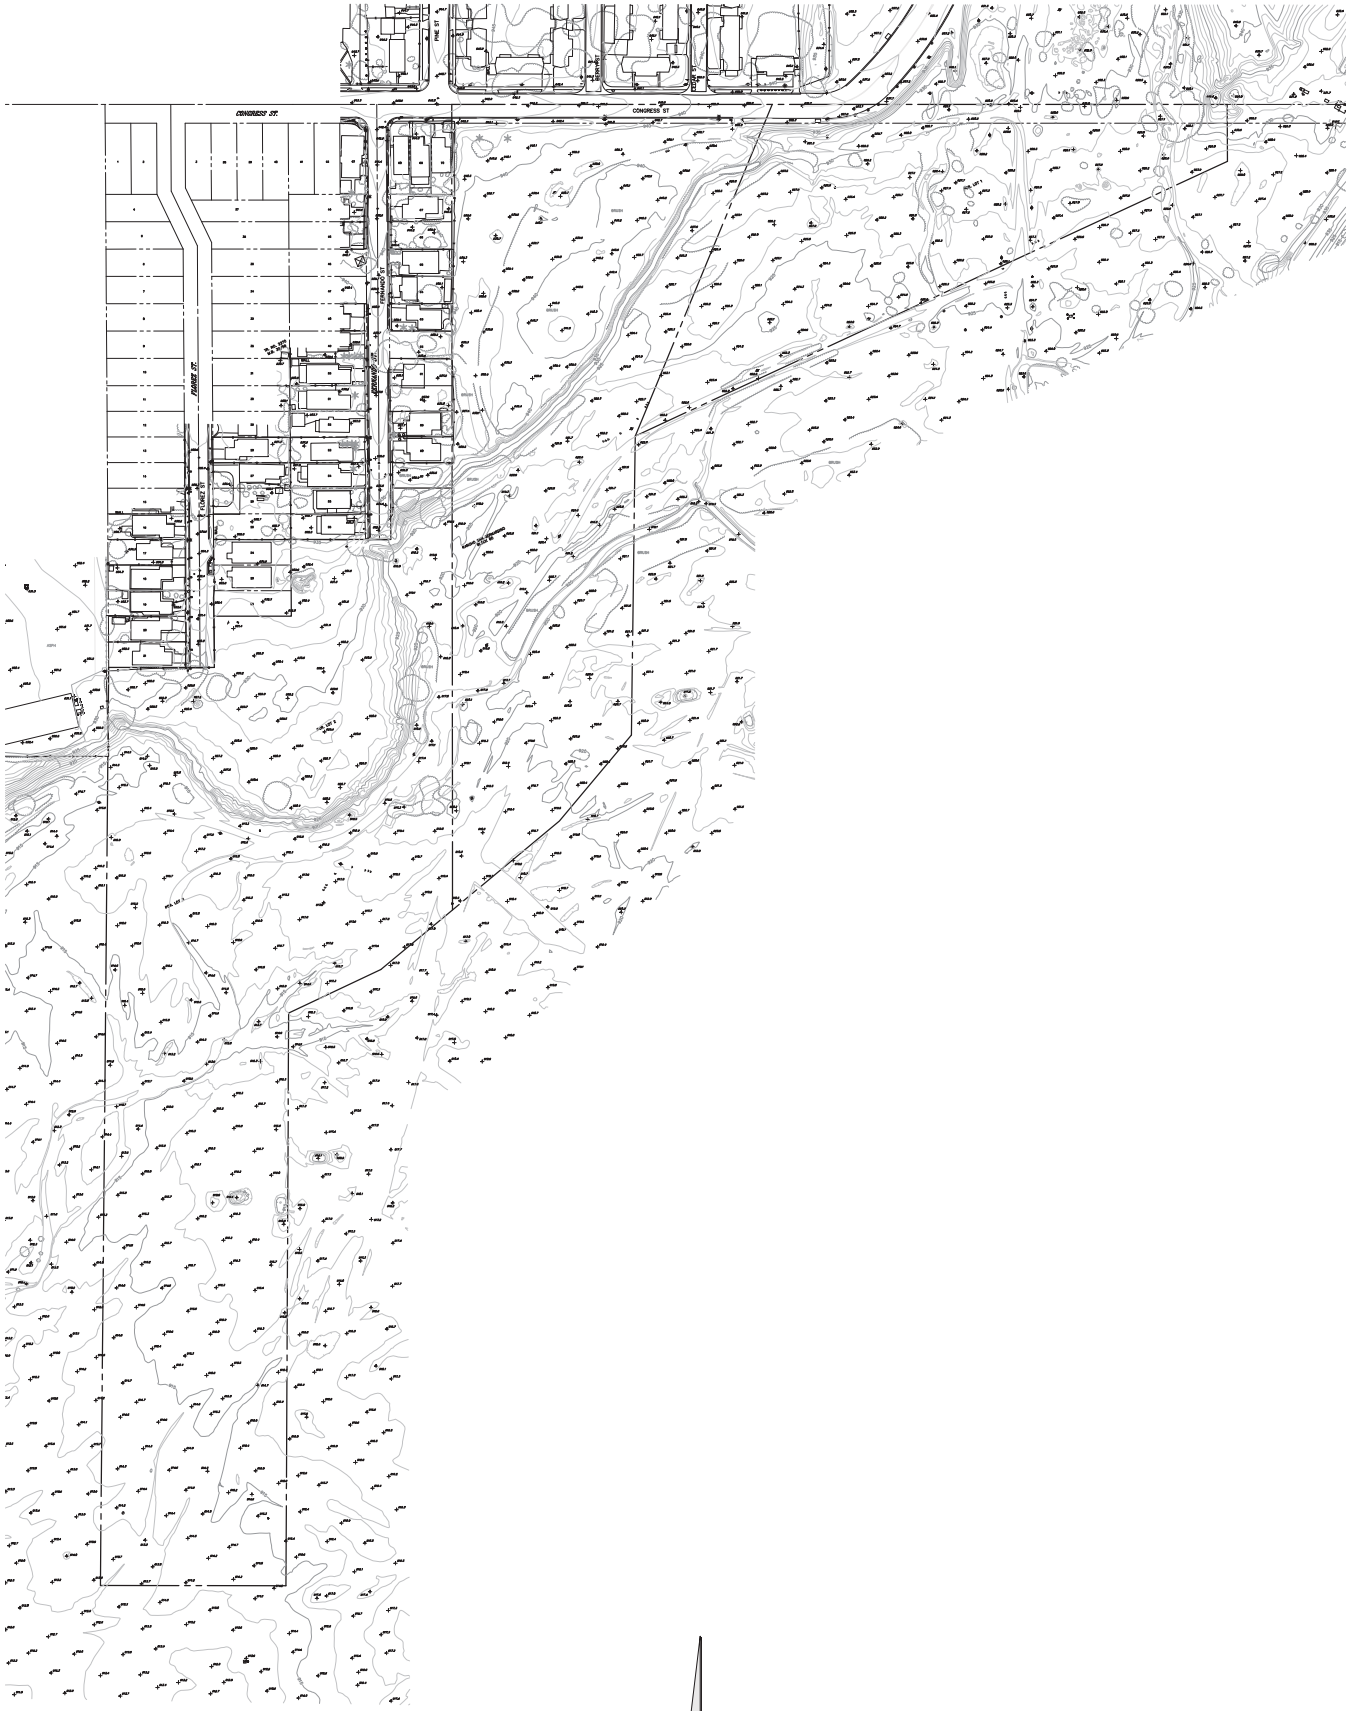
Overall clean-up costs would range from $240,000 to $330,000.[1]

Liability Concerns

According to input from the City Attorney, the City would incur no liability if we take no action to clean up the landfill. This assumes that the City had no control over the operation of the landfill during its history.

If the City hires a contractor and/or directs a contractor to perform any level of clean-up at the site, the City would be exposed to increased liability. This could be minimized by:

- Paying for the clean-up, with the landowner taking responsibility for hiring the contractor, directing the work, and submitting any reports to the Water Board and DTSC; and
- Entering into an agreement with the property owner, whereas the property owner absolves the City from any liability in exchange for the funds to perform the work.



[1] Mr. Griffin has received a cleanup quote of $6.2 million.

Funding Options

A CalRecycle AB 2136 “Solid Waste Disposal and Codisposal Site Cleanup Program” grant appears to be the sole source of funds currently available for clean-up purposes. This grant reimburses cities up to $500,000 funds for cleanup of solid waste at sites where the responsible party either cannot be identified or is unwilling or unable to pay for remediation, and where the cleanup is needed to protect public health and safety and/or the environment. If the City does not secure ownership of the property, a cooperative agreement would need to be negotiated with the landowner.

According to the CalRecycle grant contact-person, the City would need to develop a detailed clean-up plan in advance of applying for the grant in order for the application to be competitive. Therefore, I anticipate that the City would need to spend $15,000-$25,000 to review existing documentation, conduct any necessary soils studies, and prepare a clean-up plan. Because cleanup of the landfill is a City Council priority, staff is looking for unencumbered funds that could be used for this purpose. The City’s expenses could be recovered through a lien placed on the property, with City Council authorization.

Please let me know if you have any questions or desire further actions regarding clean-up of the Guyaux Landfill.

Subject: Geophysical Evaluation
Guyaux Waste Disposal Site
Colton, California

Dear Mr. Lizzi:

In accordance with your authorization, we have performed a geophysical evaluation for a portion of the Guyaux Waste Disposal Site property located at the south end of South Fernando Street and South Flores Street in Colton, California. Specifically, our services included the performance of electromagnetic and magnetic surveys at the site. The primary purpose of the study was to evaluate the presence of buried landfill debris including "foundry wastes" in the study area. This report presents the survey methodology, equipment used, analysis, and findings.

We appreciate the opportunity to be of service on this project. Should you have any questions related to this report, please contact the undersigned at your convenience.

Sincerely,
SOUTHWEST GEOPHYSICS, INC.

1. INTRODUCTION

In accordance with your authorization, we have performed a geophysical evaluation for a portion of the Guyaux Waste Disposal Site property located at the south end of South Fernando Street and South Flores Street in Colton, California (Figure 1). Specifically, our services included the performance of electromagnetic and magnetic surveys at the site. The primary purpose of the study was to evaluate the presence of buried landfill debris including "foundry wastes" in the study area. This report presents the survey methodology, equipment used, analysis, and findings.

2. SCOPE OF SERVICES

Our scope of services included:

- Performance of magnetometer and EM31 surveys across selected portions of the site.
- Compilation and geophysical analysis of the data collected.
- Preparation of this report presenting our findings and conclusions.

3. SITE DESCRIPTION

The project site is located at the south end of South Fernando Street and South Flores Street in Colton, California (Figure 1) and is consists of a vacant lot situated at the edge of the Santa Ana River. The site is bounded to the north by residential properties and to the west by an industrial property (see Figure 1). Specifically, our study area included accessible portions of the vacant lot, slope and flat area at the bottom of the slope (see Figures 2a through 2d, and Figure 3). Vegetation in the study area consists of annual grass, scattered brush/plants, and trees. Figure 3 presents the general conditions in the survey area.

4. GEOPHYSICAL INSTRUMENTATION AND APPLICATIONS

The evaluation included the use of a Geometrics G-858 cesium vapor magnetometer and Geonics EM31 terrain conductivity meter in order to delineate the presence of buried debris including "foundry wastes" at the site. The following is a brief description of each instrument and application.

4.1. Magnetometer Survey

The Geometrics G-858 is a cesium vapor magnetometer (MAG) which measures the strength of the earth's magnetic field and the superposed magnetic field of ferromagnetic materials in its vicinity. The precision of the instrument is approximately $1/10^{th}$ gamma. The earth's magnetic field strength at the project site's latitude is roughly 47,055 gammas. The earth's magnetic field is inclined in the direction of the north magnetic pole. Because of this inclination, a buried ferromagnetic object is typically expressed as a paired anomaly with a positive (above background) slightly to the south and a negative slightly in the direction of magnetic north. Solar geomagnetic activity for the magnetometer survey was predominantly quiet, according to the NOAA (National Oceanic and Atmospheric Administration) webpage (http://www.sec.noaa.gov). In addition, pre- and post-survey measurements were collected at a control station to assess diurnal variations. Variations less than 30 gammas were encountered. Due to these relatively small magnetic field variances, no diurnal corrections were made to the recorded magnetometer data. The purpose of the magnetometer survey was to evaluate the presence of ferromagnetic metals (i.e., metal debris).

4.2. EM31 Survey

The EM31 is comprised of two coils, a transmitter coil and receiver coil. The transmitter coil induces circular eddy currents that generate a magnetic field in the subsurface, which is related to the terrain conductivity. There are two components of the magnetic field which are measured by the EM31; the quadrature phase (QP) and the inphase (IP) components. The quadrature phase provides electrical conductivity measurements, in milliMhos per meter (mmho/m). The inphase measurements are the ratio of the induced secondary magnetic field to the primary magnetic field in parts per thousand (ppt). The inphase measurement is significantly more sensitive to large metallic objects than the quadrature phase. The primary purpose of the EM31 survey was to evaluate the changes in electrical conductivity in the study area that could be related to the presence of buried debris and burn waste.

5. SURVEY METHODOLOGY

In order to facilitate the collection of magnetic and electromagnetic data, a Trimble Pro XRS global positioning system (GPS) was used for spatial control. Traverses spaced roughly 10-15 feet apart were conducted across accessible portions of the survey area, which was generally defined by your office, with data points collected at 0.5 second intervals. Notable surface features such as a chain link fencing, surface debris, power poles, and other surface objects were mapped with GPS. The geophysical and GPS data were downloaded to a laptop computer in the field for preliminary analysis, and later compiled and further evaluated in the office.

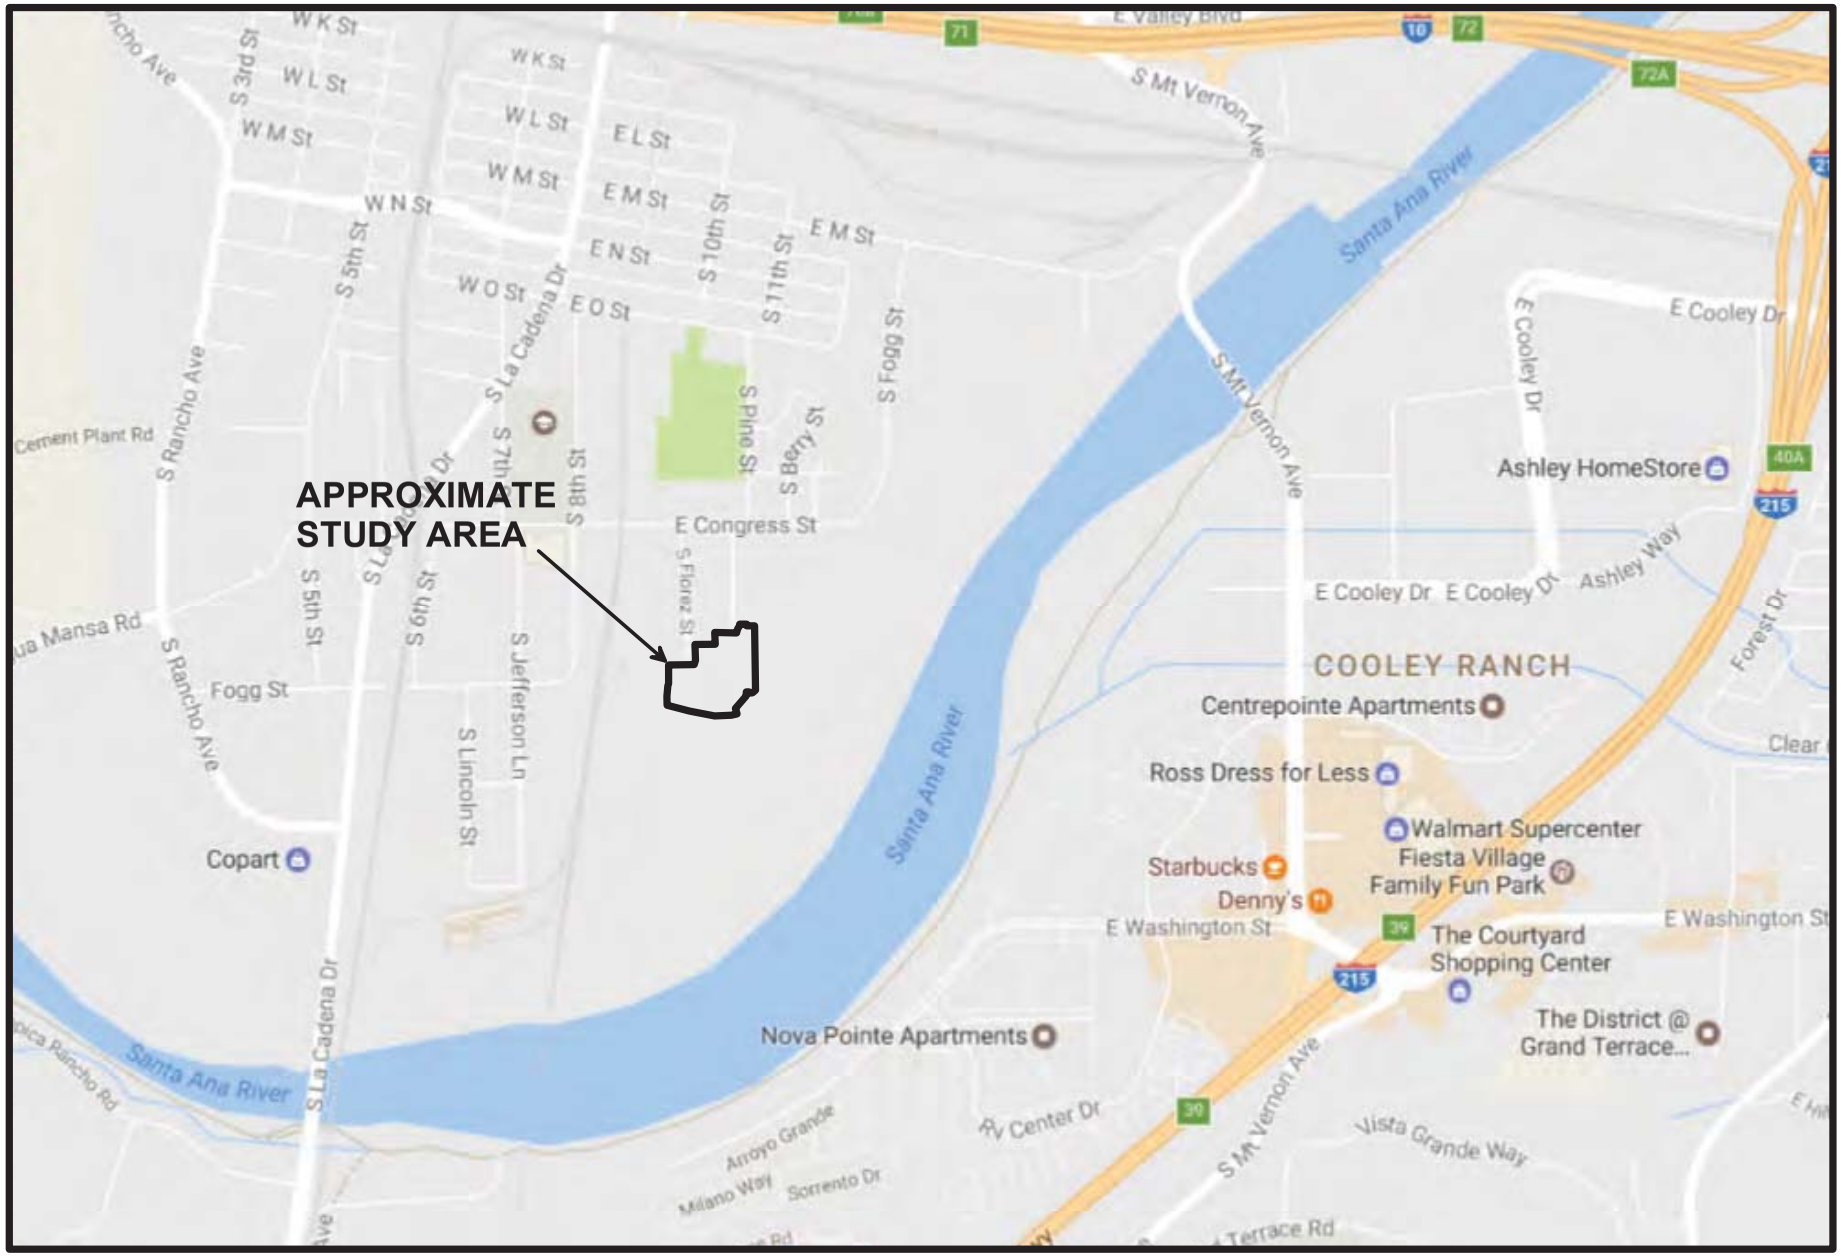
6. RESULTS AND CONCLUSIONS

As previously indicated, the purpose of the study was to evaluate the presence of buried debris including "foundry wastes" in the survey area. The results of our survey are presented in Figures 2a through 2d. Figure 2a illustrates observed site features including a monitoring well, power poles and lines, as well as the limits of the survey area.

Figure 2b presents the results from the MAG survey. Both contour lines (interval 200 gammas) and color gradient are shown on the map. Relatively significant features are revealed in the MAG data as high and low magnetic values shown with hot (red/purple) and cool (blue) colors, respectively. It should be noted that the magnetic background value is on the order of 47,055 gammas, which is shown in yellow. As exhibited in Figure 2b, large changes in the magnetic field were encountered across the vacant lot and extending toward the base of the berm. Numerous small magnetic anomalies were also detected down on the flats below the berm; however, these smaller anomalies are likely related to surface and near surface debris.

The EM31 conductivity (QP) and inphase (IP) results are presented in Figures 2c and 2d, respectively. The conductivity results are presented in mmho/m whereas the inphase results are presented in ppt. Both contour lines and color gradient are shown on the figures. For the color gradient results, the hot colors represent higher values and the cool colors represent lower values (i.e., more resistive materials are blue and more conductive materials are red). The QP and IP results reveal anomalous conditions across the vacant lot and extending toward the base of the berm. The IP results along the power pole alignment appear to have been adversely affected by interference from the overhead power lines .

In general, both the MAG and the EM31 results agree and indicate the presence of anomalous conditions across the majority of the vacant lot and extending toward the base of the berm. The buried debris may extend a bit beyond the base of the berm in some areas.



It should be noted that the presence of surface and subsurface objects can potentially limit the effectiveness of the EM and MAG surveys. Specifically, the presence of houses, vehicles, and

fencing at the north end of the study area produced an elevated response in the EM and MAG data. This effect could potentially mask over the presence of buried debris in this area. It should also be noted that the steepness of the slope in some areas limited access and potentially affected the instrument response due to changes in instrument height during data collection. In addition, the presence of the overhead power lines adversely affected the IP measurements near the lines.

7. LIMITATIONS

The field evaluation and geophysical analyses presented in this report have been conducted in general accordance with current practice and the standard of care exercised by consultants performing similar tasks in the project area. No warranty, express or implied, is made regarding the conclusions and opinions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be present. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface surveying will be performed upon request.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Southwest Geophysics, Inc. should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document. This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

DAILY FIELD REPORTS AND AIR/DUST LOGS

Ninyo & Moore — FIELD OBSERVATIONS

DATE 3/21/17	DAY 1	AUTHOR	Pedro Rodriguez (PRM)	NO. 1
PROJ. NAME Guyaux Waste Disposal Site		PROJ. NO.	209667003	Of 1
CLIENT Phil Martin & Associates				

EQUIPMENT	CONTRACTOR ICS
Hand Tools, Track mounted excavator	FOREMAN Jason
	WEATHER WARM / rainy
	PERMIT NO.

DESCRIPTION OF WORK PERFORMED AND OBSERVATIONS

0530 - To site
- Pick up ICE
0630 - arrived on site; Met Jason (ICS); Rob (ICG)
- Anthony (NMM)
- Beth (NMM)
0700 - HSP; Prepd; walked the site; Staked 5 locations
0800 - started with excavator on T-1 (near T-4)
- Finding alot of clay. and rocks (See log).
0900 - completed. T-1 Backfill.

0930 - Took Background Samples with Anthony BKG-1 thru 3
- See maps for Location
1000 - met Back up with Beth @ T-2 (Quartz)
- Cal Quartz on site
1030 - working on T-3; see log.
1040 -
1100 ~~Cal Quartz off site~~
1200 - City on site; spoke with anthony
1230 - working on T-4; Anthony off site
1300 - working on T-5 (already off site.
1330 - working on T-6 through T-8

1500 - stopped; Lab on site.
1530 - assigned samples with BAB
1600 - Off site.
1730 - Home
1800 - cleaned equipment; and prepd for tomorrow

EQUIPMENT	CONTRACTOR ICS
Hand Tools, Track mounted excavator	FOREMAN Jason
	WEATHER Rainy / Cloudy
	PERMIT NO. —

DESCRIPTION OF WORK PERFORMED AND OBSERVATIONS

0530 - to site

0635 - arrival @ site; Met with ICS crew; Jason and Albino;
- Large excavator was already on site about to be un loaded
- Summer on site.
- Rainy conditions (Rain was light More like mist)
- Calibrated equipment

0715 - Entered site; Started @ location T-9 (See logs for Details)
- Completed perimter Trenches T-9 through T-12

1100 - Working on 1/3 deep Trenches; T-13 along Northmost Fence;
- was able to complete T-13 to 18' bgs TD.
- Clean Contact @ 17'

1130 - Spoke with a guy from the neighborhood
- he mentioned that the construction debris next to the new pipes Homes came from 4' down excavated For the Footings.
- He said the dump Started @ prepstation on Florez

1200 - Lunch / Geophysics off site

1230 - Started on 2/3 deep Trenches @ T-14; Not able to complete past 15' bgs Because of Large cuves that kept caving in.

1300 - Completed T-15 to depth @ clean Contact @ 18' bgs. TD = 19.

1530 - met with Lab; Acid Samples all transfered.

1600 - off site.

1800 - Arrived @ Home.

1830 - Charged equipment and unloaded TRASH.
↳ Done

DESCRIPTION OF WORK PERFORMED AND OBSERVATIONS

0530 – To pick up ICE
– To site
0645 – arrived on site; met ICS (Jason/Albino); met Peter (N+M). Rob (ICG) on site as well.
0700 – Mob. to First location T-16 (West Most location)
– See logs For details
– @ T-16 we reached clean SAND @ ~10' bgs. No Lateral contact.
– @ T-17 & 18 we were not able to reach clean soil.
– @ T-19 through T-21 We did not Reach clean Sand.
1100 – @ T-22; we completed excavation to clean Sand @ 13' bgs (contact).
1200 – ~~Everyone~~ off site
– Lab will arrive @ 1:30.
1230 – PRM catching up on paperwork; will contact BAB for assignment of Solidification.
1400 – assigned Samples
1415 – Lab on site
1430 – PRM off site
1545 – Home
~~1600 Finish~~

GUYAUX WASTE DISPOSAL SITE
COLTON, CALIFORNIA

Project No.	Date
209667003	5/17

DATE EXCAVATED 3/21/2017 TEST PIT NO. T-1

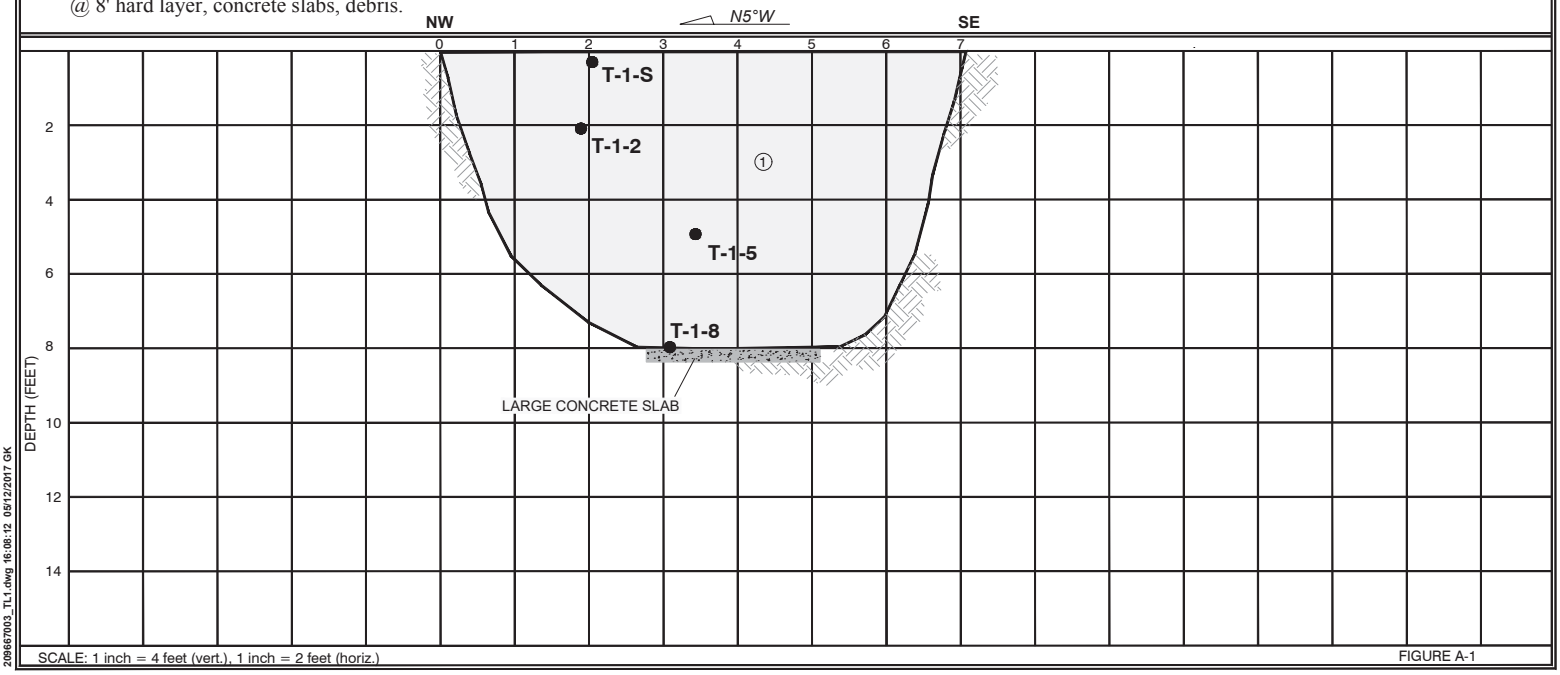
GROUND ELEVATION 929'±(MSL) LOGGED BY PRM/BAB

METHOD OF EXCAVATION Trackhoe

LOCATION Approximately 50 feet South of Terminus of S. Florez Street

DESCRIPTION/INTERPRETATION

① FILL AND WASTE DEBRIS:
(Surface contains abundant metal slag debris)
Brown-black, loose silty SAND; with gravel, cobbles; and waste debris, approximately 50-60%, consisting primarily of punky vesicular slag, metal molds, metallic disks, large pieces of slag and concrete debris, occasional broken bricks.



@ 5.5' large pieces of concrete slabs, metal pole, some asphalt debris.

@7' Brown, moist, silty SAND; with waste debris, bricks

@ 8' hard layer, concrete slabs, debris.

NOTES

T.D.= 8 feet bgs.
Groundwater not encountered during excavation.
Excavation Backfilled on 03-21-17.
Refusal on hard surface/material, concrete slabs/debris.
Slag and metalwaste at the surface.

SCALE: 1 inch = 4 feet (vert.), 1 inch = 2 feet (horiz.)

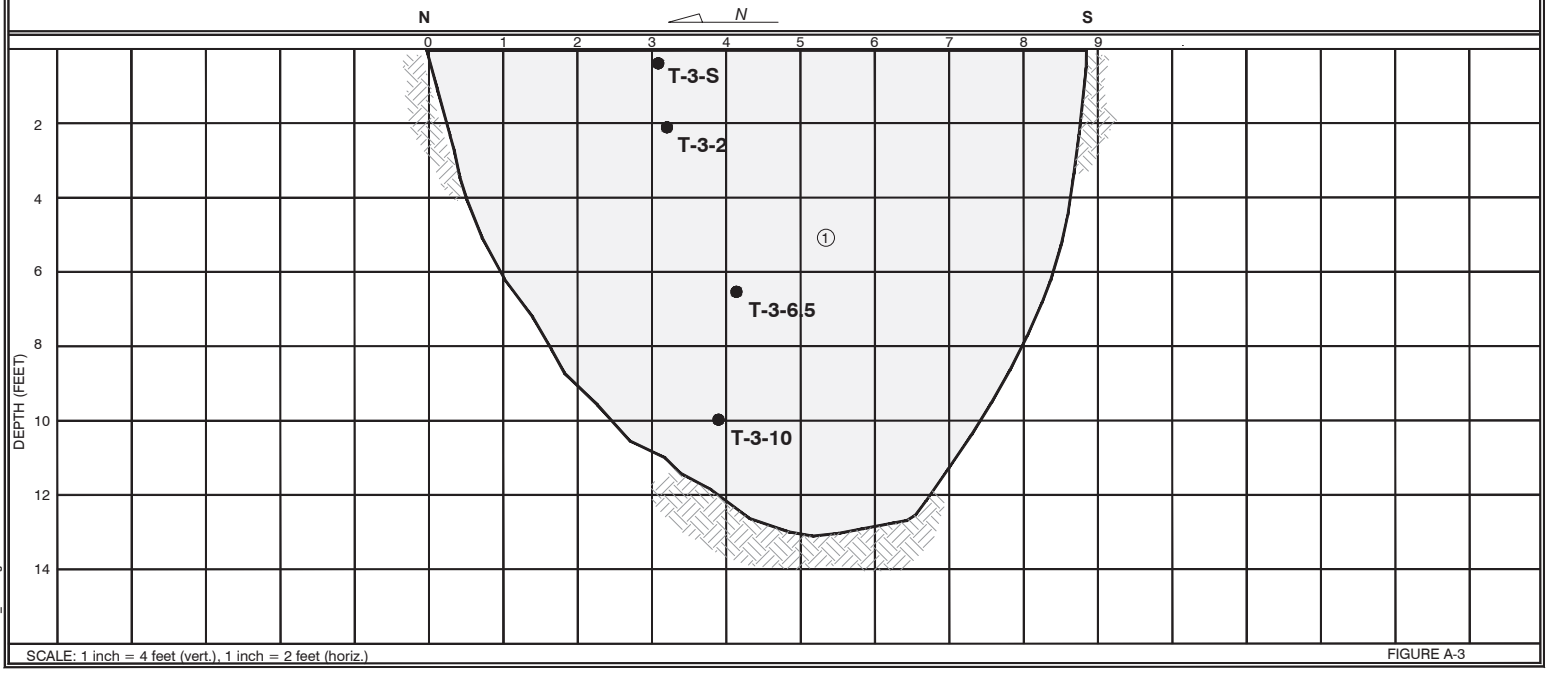
DATE EXCAVATED 3/21/2017 TEST PIT NO. T-3

GROUND ELEVATION 934'±(MSL) LOGGED BY PRM/BAB

METHOD OF EXCAVATION Trackhoe

LOCATION Northern Project Boundary, Adjacent south of Residences



DESCRIPTION/INTERPRETATION

① FILL AND CONSTRUCTION DEBRIS:
Brown, damp to moist, loose, silty SAND; with gravel and cobbles, and construction debris, approximately 35-50% consisting primarily of large concrete debris 2x1x5, 2x1.5x5, asphalt, metal, bricks, insulation, tiles, large metal drum lid, scrap metal.

@ 10' increased asphalt debris, sand becomes coarse and with rounded gravels ~ 1 to 2" in size, occasional wood.

NOTES

T.D.= 13 feet bgs.
Groundwater not encountered during excavation.
Excavation Backfilled on 03-21-17.

SCALE: 1 inch = 4 feet (vert.), 1 inch = 2 feet (horiz.)

Data Qualifiers and Definitions

Qualifiers

A	See Report Comments.
B	Analyte was present in an associated method blank.
B1	Analyte was present in a sample and associated method blank greater than MDL but less than RDL.
BQ1	No valid test replicates. Sample Toxicity is possible. Best result was reported.
BQ2	No valid test replicates.
BQ3	No valid test replicates. Final DO is less than 1.0 mg/L. Result may be greater.
C	Possible laboratory contamination.
D	RPD was not within control limits. The sample data was reported without further clarification.
D1	Lesser amount of sample was used due to insufficient amount of sample supplied.
D2	Reporting limit is elevated due to sample matrix. Target analyte was not detected above the elevated reporting limit.
DW	Sample result is calculated on a dry weigh basis.
E	Concentration is estimated because it exceeds the quantification limits of the method.
I	The sample was read outside of the method required incubation period.
J	Reported value is estimated
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
M1	The matrix spike (MS) or matrix spike duplicate (MSD) is not within control limits due to matrix interference.
M2	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits. The associated LCS and/or LCSD was not within control limits. Sample result is estimated.
N1	Sample chromatography does not match the specified TPH standard pattern.
NC	The analyte concentration in the sample exceeded the spike level by a factor of four or greater, spike recovery and limits do not apply.
P	Sample was received without proper preservation according to EPA guidelines.
P1	Temperature of sample storage refrigerator was out of acceptance limits.
P2	The sample was preserved within 24 hours of collection in accordance with EPA 218.6.
Q1	Analyte Calibration Verification exceeds criteria. The result is estimated.
Q2	Analyte calibration was not verified and the result was estimated.
Q3	Analyte initial calibration was not available or exceeds criteria. The result was estimated.
S	The surrogate recovery was out of control limits due to matrix interference. The associated method blank surrogate recovery was within control limits and the sample data was reported without further clarification.
S1	The associated surrogate recovery was out of control limits; result is estimated.
S2	The surrogate was diluted out due to the presence of high concentrations of target and/or non-target compounds. Surrogate recoveries in the associated batch QC met recovery criteria.
S3	Internal Standard did not meet recovery limits. Analyte concentration is estimated.
T	Sample was extracted/analyzed past the holding time.
T1	Reanalysis was reported past hold time due to failing replicates in the original analysis (BOD only).
T2	Sample was analyzed ASAP but received and analyzed past the 15 minute holding time.
T3	Sample received and analyzed out of hold time per client's request.
T4	Sample was analyzed out of hold time per client's request.
T5	Reanalysis was reported past hold time. The original analysis was within hold time, but not reportable.
T6	Hold time is indeterminable due to unspecified sampling time.
T7	Sample was analyzed past hold time due to insufficient time remaining at time of receipt.

Definitions

DF	Dilution Factor
MDL	Method Detection Limit. Result is reported ND when it is less than or equal to MDL.
ND	Analyte was not detected or was less than the detection limit.
NR	Not Reported. See Report Comments.
RDL	Reporting Detection Limit
TIC	Tentatively Identified Compounds

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Ninyo & Moore Project: Guyuna

Date Received: 3/21/17 Sampler's Name Present: (Yes) No

Sample(s) received in a cooler? Yes How many? _____ No (skip section 2) Sample Temp (°C): _____

Sample Temp (°C) from each cooler: #1: 7.9 #2: _____ #3: _____ #4: _____

(Acceptance range is 0 to 6°C or, for samples collected the same day as sample receipt, arrival on ice; For Micrabiology sample 0 to 10°C or, for samples collected the same day as sample receipt, arrival on ice)

Shipping Information: _____

Section 2

Was the cooler packed with: X Ice ____ Ice Packs ____ Bubble Wrap ____ Styrofoam

____ Paper ____ None ____ Other _____

Cooler Temp (°C): #1: 0.2 #2: _____ #3: _____ #4: _____

Section 3	YES	NO	N/A
Was a COC received?	X		
Are sample IDs present?	X		
Are sampling dates & times present?	X		
Is a relinquished signature present?	X		
Are the tests required clearly indicated on the COC?	X		
Are custody seals present?		X	
If custody seals are present, were they intact?			X
Are all samples sealed in plastic bags? Recommended for Microbiology samples)	X		
Did all samples arrive intact? If no, indicate in Section 4 below.	X		
Did all bottle labels agree with COC? (ID, dates and times)	X		
Were the samples collected in the correct containers for the required tests?	X		
Are the containers labeled with the correct preservatives?			X
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			X
Was a sufficient amount of sample submitted for the requested tests?	X		

Section 4

Explanations/Comments: _____

Section 5

For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____

Email (email sent to/on): _____ / _____

Project Manager's response:

Ranjit,
Please run the analyzes marked in blue in the attached table.
Sorry for the delay, but we need these to run within the holding time. I think tomorrow is the holding time for some of these.

Thanks, sorry for the last minute request.

Supplemental Report 1

This laboratory request covers the following listed samples which were analyzed for the parameters indicated on the attached Analytical Result Report. All analyses were conducted using the appropriate methods. Methods accredited by NELAC are indicated on the report. This cover letter is an integral part of the final report.

Data Qualifiers and Definitions

Qualifiers

A	See Report Comments.
B	Analyte was present in an associated method blank.
B1	Analyte was present in a sample and associated method blank greater than MDL but less than RDL.
BQ1	No valid test replicates. Sample Toxicity is possible. Best result was reported.
BQ2	No valid test replicates.
BQ3	No valid test replicates. Final DO is less than 1.0 mg/L. Result may be greater.
C	Possible laboratory contamination.
D	RPD was not within control limits. The sample data was reported without further clarification.
D1	Lesser amount of sample was used due to insufficient amount of sample supplied.
D2	Reporting limit is elevated due to sample matrix. Target analyte was not detected above the elevated reporting limit.
DW	Sample result is calculated on a dry weigh basis.
E	Concentration is estimated because it exceeds the quantification limits of the method.
I	The sample was read outside of the method required incubation period.
J	Reported value is estimated
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
M1	The matrix spike (MS) or matrix spike duplicate (MSD) is not within control limits due to matrix interference.
M2	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits. The associated LCS and/or LCSD was not within control limits. Sample result is estimated.
N1	Sample chromatography does not match the specified TPH standard pattern.
NC	The analyte concentration in the sample exceeded the spike level by a factor of four or greater, spike recovery and limits do not apply.
P	Sample was received without proper preservation according to EPA guidelines.
P1	Temperature of sample storage refrigerator was out of acceptance limits.
P2	The sample was preserved within 24 hours of collection in accordance with EPA 218.6.
Q1	Analyte Calibration Verification exceeds criteria. The result is estimated.
Q2	Analyte calibration was not verified and the result was estimated.
Q3	Analyte initial calibration was not available or exceeds criteria. The result was estimated.
S	The surrogate recovery was out of control limits due to matrix interference. The associated method blank surrogate recovery was within control limits and the sample data was reported without further clarification.
S1	The associated surrogate recovery was out of control limits; result is estimated.
S2	The surrogate was diluted out due to the presence of high concentrations of target and/or non-target compounds. Surrogate recoveries in the associated batch QC met recovery criteria.
S3	Internal Standard did not meet recovery limits. Analyte concentration is estimated.
T	Sample was extracted/analyzed past the holding time.
T1	Reanalysis was reported past hold time due to failing replicates in the original analysis (BOD only).
T2	Sample was analyzed ASAP but received and analyzed past the 15 minute holding time.
T3	Sample received and analyzed out of hold time per client's request.
T4	Sample was analyzed out of hold time per client's request.
T5	Reanalysis was reported past hold time. The original analysis was within hold time, but not reportable.
T6	Hold time is indeterminable due to unspecified sampling time.
T7	Sample was analyzed past hold time due to insufficient time remaining at time of receipt.

Definitions

DF	Dilution Factor
MDL	Method Detection Limit. Result is reported ND when it is less than or equal to MDL.
ND	Analyte was not detected or was less than the detection limit.
NR	Not Reported. See Report Comments.
RDL	Reporting Detection Limit
TIC	Tentatively Identified Compounds

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: NINYO & MOORE Project: _____

Date Received: 3/22/17 Sampler's Name Present: (Yes) No

Sample(s) received in a cooler? (Yes) How many? 1 No (skip section 2) Sample Temp (°C): _____

Sample Temp (°C) from each cooler: #1: 5.9°C #2: _____ #3: _____ #4: _____

(Acceptance range is 0 to 6°C or, for samples collected the same day as sample receipt, arrival on ice; For Microbiology sample 0 to 10°C or, for samples collected the same day as sample receipt, arrival on ice)

Shipping Information: _____

Section 2

Was the cooler packed with: ✓ Ice ____ Ice Packs ____ Bubble Wrap ____ Styrofoam

____ Paper ____None ____ Other_____

Cooler Temp (°C): #1: 3.9°C #2: _____ #3: _____ #4: _____

Section 3	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? Recommended for Microbiology samples)	✓		
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 4

Explanations/Comments: _____

Section 5

For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____

Email (email sent to/on): _____ / _____

Project Manager's response: _____

Completed By: _____ Date: 3/22/17

Ranjit,
On the attached COC dated 3/22/17. Could you please run VOCs and SVOCs on Sample ID **T-11-5.**

Thanks,

Pedro Rodriguez-Mendez

Ranjit,
Please run the analyzes marked in blue in the attached table.
Sorry for the delay, but we need these to run within the holding time. I think tomorrow is the holding time for some of these.

Thanks, sorry for the last minute request.

Data Qualifiers and Definitions

Qualifiers

A	See Report Comments.
B	Analyte was present in an associated method blank.
B1	Analyte was present in a sample and associated method blank greater than MDL but less than RDL.
BQ1	No valid test replicates. Sample Toxicity is possible. Best result was reported.
BQ2	No valid test replicates.
BQ3	No valid test replicates. Final DO is less than 1.0 mg/L. Result may be greater.
C	Possible laboratory contamination.
D	RPD was not within control limits. The sample data was reported without further clarification.
D1	Lesser amount of sample was used due to insufficient amount of sample supplied.
D2	Reporting limit is elevated due to sample matrix. Target analyte was not detected above the elevated reporting limit.
DW	Sample result is calculated on a dry weigh basis.
E	Concentration is estimated because it exceeds the quantification limits of the method.
I	The sample was read outside of the method required incubation period.
J	Reported value is estimated
L	The laboratory control sample (LCS) or laboratory control sample duplicate (LCSD) was out of control limits. Associated sample data was reported with qualifier.
M	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits due to matrix interference. The associated LCS and/or LCSD was within control limits and the sample data was reported without further clarification.
M1	The matrix spike (MS) or matrix spike duplicate (MSD) is not within control limits due to matrix interference.
M2	The matrix spike (MS) or matrix spike duplicate (MSD) was not within control limits. The associated LCS and/or LCSD was not within control limits. Sample result is estimated.
N1	Sample chromatography does not match the specified TPH standard pattern.
NC	The analyte concentration in the sample exceeded the spike level by a factor of four or greater, spike recovery and limits do not apply.
P	Sample was received without proper preservation according to EPA guidelines.
P1	Temperature of sample storage refrigerator was out of acceptance limits.
P2	The sample was preserved within 24 hours of collection in accordance with EPA 218.6.
Q1	Analyte Calibration Verification exceeds criteria. The result is estimated.
Q2	Analyte calibration was not verified and the result was estimated.
Q3	Analyte initial calibration was not available or exceeds criteria. The result was estimated.
S	The surrogate recovery was out of control limits due to matrix interference. The associated method blank surrogate recovery was within control limits and the sample data was reported without further clarification.
S1	The associated surrogate recovery was out of control limits; result is estimated.
S2	The surrogate was diluted out due to the presence of high concentrations of target and/or non-target compounds. Surrogate recoveries in the associated batch QC met recovery criteria.
S3	Internal Standard did not meet recovery limits. Analyte concentration is estimated.
T	Sample was extracted/analyzed past the holding time.
T1	Reanalysis was reported past hold time due to failing replicates in the original analysis (BOD only).
T2	Sample was analyzed ASAP but received and analyzed past the 15 minute holding time.
T3	Sample received and analyzed out of hold time per client's request.
T4	Sample was analyzed out of hold time per client's request.
T5	Reanalysis was reported past hold time. The original analysis was within hold time, but not reportable.
T6	Hold time is indeterminable due to unspecified sampling time.
T7	Sample was analyzed past hold time due to insufficient time remaining at time of receipt.

Definitions

DF	Dilution Factor
MDL	Method Detection Limit. Result is reported ND when it is less than or equal to MDL.
ND	Analyte was not detected or was less than the detection limit.
NR	Not Reported. See Report Comments.
RDL	Reporting Detection Limit
TIC	Tentatively Identified Compounds

Subject: Additional analyses for Guyaux Landfill
Attachments: Guyaux Sample Analysis Counts.xlsx

Ranjit,
Please run the analyzes marked in blue in the attached table.
Sorry for the delay, but we need these to run within the holding time. I think tomorrow is the holding time for some of these.

Thanks, sorry for the last minute request.

1 INTRODUCTION

This letter report presents the results of an historical aerial photograph evaluation conducted at the Guyaux Waste Disposal Site (WDS). A previous Phase II Environmental Site Assessment (ESA) (Ninyo & Moore, 2017) evaluated the locations, types, and extent of wastes at the WDS within the City of Colton property boundary, as related to the proposed Colton Regional Soccer Complex Redevelopment project in Colton, California. According to information contained in the California Department of Resources Recycling and Recovery (CalRecycle) SWIS database for the Guyaux WDS, the landowner is indicated as Mr. Ralph Guyaux and the current land owner is indicated as the City of Colton, Development Services Department (City of Colton). The previous Phase II ESA was limited to property owned by the City of Colton.

According to the CalRecycle Solid Waste Information System (SWIS) database, the Guyaux WDS is a closed, pre-regulation solid waste disposal site (e.g., predates regulations for solid waste disposal sites). The WDS reportedly ceased operations in December 1985 and is assigned No. 36-CR-0025. According to the SWIS database accessed in December 2017, there are no inspections or enforcement action records for 36-CR-0025 issued by the County of San Bernardino, Department of Environmental Health, acting as the Solid Waste Local Enforcement Agency (LEA).

2 PROJECT OBJECTIVE

The primary objective of this project was to evaluate the lateral extent of wastes related to the Guyaux WDS based on review of available historical aerial photographs and topographic maps, site reconnaissance, and relevant background information. The focus was on evaluating the northern and western waste extents since the results of the March 2017 Phase II ESA suggested wastes likely extend beyond the City of Colton property boundary in these directions based on waste thicknesses observed in exploratory trenches at these property boundaries. The results of the Phase II ESA suggested that some residential properties near the southern terminus of S Florez Street may be underlain by wastes. In addition, wastes appeared to extend beyond the City of Colton property to the west and onto a commercial property that appears to be owned by the Griffin Family Trust.

3 SITE LOCATION AND DESCRIPTION

The Guyaux WDS is located in the City of Colton, to the north and west of the Santa Ana River/Channel. The northernmost extent of the WDS is relatively level beginning at the southern terminus of S Florez and S Fernando Streets slopes to the east, south and southwest. Wastes appear to underlie the southern extent of S. Florez Street, several residential properties and residential properties currently under construction and the southern portion of S Fernando Street and at least one residence. At the terminus of S Florez and S Fernando Streets, the WDS generally consists of a circular mound shaped area that toward the Santa Ana River/Channel (Figures 1 and 2).

4 ENVIRONMENTAL BACKGROUND

The following is an abbreviated summary of the waste disposal activities conducted at the Guyaux WDS. The information is from the Phase II ESA report (Ninyo & Moore, 2017), which included a summary of background information provided by others. The reader is referred to the Phase II ESA report for additional information.

Late 1930s: construction debris including used bricks, concrete, asphalt, steel, wood, and other materials generated from the 1938 City of Colton flooding.

Late 1950s: the WDS was used to store used bricks which were cleaned and re-sold for construction activities. The waste products generated from the used brick cleaning reportedly were used as fill at the WDS.

In 1973: Mr. Ralph Guyaux began a "20-year purchase" of the property, which previously had an agreement with the **Crane Company** (aka Colton Manufacturing) to accept plaster molds from the production of bathroom fixtures and broken porcelain (start date of waste acceptance not reported).

1977 to 1978: Background documents and reports indicate that in 1977, the site began to accept "black slag" iron waste from the **Griffin Wheel Company**. Materials disposed of at the WDS reportedly included construction debris, plaster molds, broken porcelain, and waste foundry slag. Reportedly, these waste materials were disposed of directly onto the exposed soil surface. Steel and wood beams were also stored at the WDS for reuse until the **mid-1980s.** Background information indicates that both companies were located in the City of Colton. A February 1957 San Bernardino Sun newspaper indicates that the Griffin Wheel Company was located at Washington Street & Jefferson Lane in Colton. S Jefferson Lane and W Washington Street appear to have been similarly located just north of the Santa Ana River and southwest of the WDS. **The 2009 EDR report indicates the Griffin Wheel Dump, Chevron Chemical, Plexco Division (Chevron) and Colton Landfill located at 1280 Jefferson Street (intersection of S Jefferson Lane and Fogg Street) to the west of the railroad tracks.**

According to a letter from the Santa Ana Regional Water Quality Control Board (RWQCB) addressed to Mr. Guyaux, dated **November 16, 1977**, the RWQCB analyzed a leachate sample of the molding material from the Crane Company, found the material to be "significantly soluble in water," and requested that Mr. Guyaux not accept further wastes from the **Crane Company.** The RWQCB also requested that waste should not be accepted from the **Griffin Wheel**

Company under the assumption that a leachate analysis of the "black ash material" (slag) would "also have similar results." The RWQCB requested that the "black ash material" be analyzed and a Waste Discharge Report (WDR) be submitted.

In a letter to the RWQCB, dated **January 27 1978,** Mr. Guyaux submitted a partially completed Waste Discharge Report (dated December 29, 1977) and indicated **Colton Manufacturing (Crane Company)** had been notified that molds and fixtures were no longer permitted to be disposed of at the site. Mr. Guyaux also indicated black ash material from **Griffin Wheel** had not been disposed of at the site for six months and that he had collected a sample of the material for analysis. In **1981,** Mr. Guyaux indicated the "ash material" analytical results were either never reported or lost. However, according to an interview conducted by Roy F. Weston (Weston) in **1993** as part of their Preliminary Assessment, Mr. Guyaux stated he never collected a waste sample because the RWQCB wouldn't issue him a permit to operate the landfill. He also indicated the WDS stopped accepting wastes in **1981** when directed to do so by the RWQCB, however Weston reported waste disposal ceased by **1985**.
From ~1985 to the mid-1990s: Background information indicates that the WDS was used to temporarily store automobiles and machinery prior to reuse.

1993: Weston conducted a preliminary assessment and indicated that they observed wood, concrete, asphalt, bricks, old tires, mattresses, household refuse, furniture, fragments of steel and metal, car and truck frames, empty drums, car fuel tanks, telephone poles, and a crushed fuel tank (approximately 500 gallons) at the WDS property.

March, 2017: Ninyo & Moore conducted a Phase II ESA of the Guyaux WDS within the boundary of the WDS property owned by the City of Colton, for the purposes of characterizing and delineating the wastes and to evaluate the potential presence of cover overlying wastes, to provide an estimate of the in-place volume of wastes based on locations explored, and to conduct sufficient analytical testing to generally characterize the wastes. The Phase II ESA included excavating, logging, sampling and documenting 21 exploratory trench excavations within the boundary and one trench excavation on the adjacent, offsite, vacant property to the north (total of 22 exploratory trenches).

Based on the 22 exploratory trenches, waste was observed at depths ranging from the surface to approximately 19 feet bgs. In general, two types of wastes were observed: construction debris and metal wastes. The construction debris generally consisted of concrete, brick, plaster mold, insulations, tile, wood, toilet, and asphalt which based on background information, appears to be related to flooding and brick cleaning. The metal wastes generally consisted of metal disk molds, slag and what appears to be darkly colored soils/metallic dust (and plaster molds), which based on background information appears to be related to wastes generated from the Griffin Wheel Company and porcelain molds from the Crane Company and disposed of at the WDS. **Metal and construction wastes were observed to be exposed at the surface in March 2017.**

5 HISTORICAL AERIAL PHOTOGRAPHS AND TOPOGRAPHIC MAPS

Historical aerial photographs dating from 1938 through 2016 and historical topographic maps dating from 1896 through 2012 were reviewed to obtain background information about the extent of the WDS. The lateral extent of waste was generally delineated to the southwest, south, southeast and east; however, based on results of the Phase II ESA, wastes extended beyond the City of Colton owned property boundaries to the north and west. To evaluate the lateral

extent of waste in these directions, the recent topographic map of the WDS and vicinity and results of the March 2016 were overlain onto aerial photographs for the years 1938 to 2016.

The summary below is an interpretation of the photographs and is focused on information related to the lateral extent of the WDS and is not intended to be a complete description of all historical site conditions. The primary objective of the historical aerial photograph review was to identify whether wastes may underlie residential properties located at the southernmost extent of S Florez and S Fernando Streets (e.g., north and west of the City-owned portion of the WDS). Appendix A are the historical aerial photographs with information related to the estimated extent of the Guyaux WDS and also include additional possibly relevant information. Appendix B are the aerial photographs and topographic maps provided by Environmental Data Resources, Inc. (EDR).

1896, 1898 and 1901 Topographic Maps – The WDS and immediate vicinity are similar in the three topographic maps. The maps indicate an east-west trending road extends easterly and bisects the future location of the WDS. The future WDS is located immediately adjacent to and north of the Sana Ana River. S Fernando Street does not appear to have been constructed.

1938 Topographic Map – The east-west trending road terminates prior to reaching the WDS, at the location of the railroad tracks. Consistent with other background data, including aerial photographs, the WDS is located within the flooded Santa Ana River. The Riverside Canal is located to the southeast of the WDS. The Southern Pacific Railroad tracks and State Highway No 18 are located west of the WDS.

1938 Aerial Photograph – The 1938 photograph indicates the WDS as undeveloped land. The flooded Santa Ana River, trending northeast to southwest has inundated the majority of the site. Some agricultural and residential properties are located north-northwest of the site. North to south trending, unpaved, S Florez and S Fernando Streets appear as dirt roads to the adjacent north of the site. The Southern Pacific railroad tracks are located west of the site.

1943 Topographic Map – Indicates the WDS area is located within the Santa Ana River. Some additional structures (residences) have been constructed on S Florez Street. The northern extent of the river/flood area is approximately the same as in the 1938 photograph.

1949 Aerial Photograph – The site remains undeveloped in the 1949 aerial photograph. The Santa Ana River appears dry; however, the site still shows the effects of being inundated by the river. Trees and other vegetation delineate the northwestern extent of the flooded area. Additional residential properties appear to the north of the site at the terminus of unpaved S Florez and S Fernando Streets. The northern extent of the river/flood area is approximately the same as in the

1938 aerial photograph, with the major difference being that the northern boundary or extent of the flood plain/river is the location of shrubs/trees generally paralleling the river.

The 1949 aerial photograph indicates a property to the adjacent west-northwest that although not entirely clear, the surface disturbance at this offsite location appears to be related to waste disposal. Please also see the summary for the 1968 aerial photograph.

1953 Aerial Photograph – The site continues to be undeveloped in the 1953 aerial photograph with the exception of a relatively narrow "U"-shaped dirt road or path extending on the west side from the southern terminus of S Florez Street then continuing to the east and then connecting back to the area south of S Fernando Street. To the adjacent north and at the western side of the terminus of S Fernando Street is a structure interpreted to be a residential property. To the northeast at a location east of S Fernando and south of E Congress Streets, is a well-defined unpaved loop road. South of the southern portion of the loop appears disturbed and may be the location of some dumping. Areas to the south, west and possibly to the east appear disturbed. The northwestern portion of the site appears to contain increased vegetation and the southwestern extent appears to remain as a dry riverbed area. Additional residential properties are located along S Florez and S Fernando Streets, with several homes located at or south of the terminus of these unpaved streets.

1954 Topographic Map – The southern portion of the WDS is located within the northern portion of the Sana Ana River; stream channel which consist of two separate channels or stream beds in the area. The northern channel or stream bed traverses the southern portion of the site. Additional residences are located along S Florez and S Fernando Streets. (Woodrow) Wilson School is located northeast of the WDS across E. Congress Street and South Park (currently Veterans Park) is located north of the WDS and north of Congress Street.

1959 Aerial Photograph – The site remains undeveloped. A stream/river related to the Santa Ana River Channel traverses the site from northeast to southwest at the southern portion of the site. Some surface disturbance, possibly, but not known, fill? appears to extend south from the terminus of S Florez Street and continues to the southwest, generally paralleling the northern flood boundary of 1938 and also extends easterly at the current location of residential structures and the vacant lot that was the location of previous exploratory trench T-2 that encountered waste. Although not clear, there appears to be some surface disturbances at the northeastern site area, south of the terminus of S Fernando Street. The unpaved loop road described in the 1953 aerial photograph (northeast, east of S Fernando and south of E Congress Streets), is no longer present.

1966 Aerial Photograph – The 1966 aerial photograph is grainy with poor resolution. Areas at the terminus of S Florez Street, to the east-southeast and southwest appear to be disturbed/possibly locations of waste with the southern extent generally appearing to be the northern extent of the earlier stream channel during and shortly after flooding. The stream bed/river associated with the Santa Ana River channel has changed and is an "inverted V" traversing across the southwestern area of the WDS area and extending close to the northern extent of the WDS area.

1967 Topographic Map – The topographic map shows S Florez and S Fernando Streets and vicinity shaded pinkish-red indicating the area is developed. The Santa Ana River is located south of the WDS and to the adjacent north of the river/stream channel is the aqueduct.

1968 Aerial Photograph – In the 1968 photograph, it appears that waste disposal extends southerly as indicated by several relatively well defined circular/elliptical shaped areas of darkly colored material that appear to be related to waste disposal. One of the areas is at the northwestern portion of the WDS and extends northerly onto the currently vacant lot, with areas north of this also appearing disturbed, but lighter colored. Other areas are to the northeast and east and slightly smaller. Between these areas is a lightly colored area also possibly related to dumping/waste disposal. Although difficult to discern, it appears that within the WDS area and near the northern area of the dump is what appears to be a truck likely related to waste disposal. Similar appearing vehicles also appear to be located at the northern waste disposal area, one near the terminus of S Florez Street and the other possibly near the northern extent of the waste disposal area. The two circular/elliptical shaped features suggest dumping from the north onto a southerly sloping surface, creating a waste slope to the south-southeast and east.

The 1968 aerial photograph indicates the offsite property to the adjacent west-northwest with a road that appears to extend south from this location and terminates near the river at a location that appears to be used for dumping. This suggests that waste disposal at the Guyaux WDS was not only from S Florez Street, but also via an access road related to the property to the adjacent west-northwest. Although not entirely clear, it appears that the wastes observed at exploratory trench T-16 (Phase II ESA) extends to the west (outlying the City of Colton property boundary) related to dumping that appears to be apparent in this photograph.

1973 Topographic Map – This topographic map appears similar to the previous 1967 map. The Santa Ana River is located south of the WDS and to the adjacent north of the river/stream channel is the aqueduct.

1975 Aerial Photograph – This infrared photograph is poor resolution; however, the WDS is shown fairly clearly and appears to be a roughly circular shaped area with lighter colored areas radiating outward particularly to the northeast and south, appearing to be related to dumped materials. S Florez Street appears to terminate at or near the northern extent of the WDS. Several dirt roads or paths appear leading to and from the waste disposal area. The northern extent of wastes appears to be the locations of current residential properties east and west of S Florez Street. There appears to be a poorly defined unpaved road originating from the adjacent property to the west-northwest (area of surface disturbance possibly related to waste disposal) extending onto the Guyaux WDS.

1985 Aerial Photograph – The 1985 infra-red aerial photograph continues to show evidence of waste dumping at the site. A looping dirt road extending from S Florez Street appears to be located on wastes at the central portion of the WDS. The road likely was used by trucks to access the dump area and circle back up to S Florez Street. Debris is visible on the slope areas of the waste disposal area. The darker colored debris may be related to wastes from the Griffin Wheel Company waste disposal. Areas of darkly colored, metal-bearing dust and slag were observed at the surface at numerous locations during the March 2017 Phase II ESA. Lighter colored areas appear to be roads and lighter colored wastes/debris.

1989 Aerial Photograph – The 1989 aerial photograph continues to show evidence of waste dumping at the site. The looping dirt road extending from S Florez Street is well defined and appears to be located on wastes at the central portion of the WDS. Recent dumping originating from the loop road appears to have been conducted from the road and extends to the south-southwest and southeast of the road. Relatively large square to rectangular-shaped materials/wastes/debris are located down slope of the loop road and suggest dumping from the loop-shaped access road. Relatively well defined trails or paths extend to and from, and bisect the WDS. Well-defined east west trending dirt roads traverse the open space area to the south and east of the WDS.

1995 Aerial Photograph – In the 1995 aerial photograph, the looping dirt road assumed to be the dumping access road for waste disposal is no longer present. S Florez Street has been extended further south and two homes have been constructed on the west side of the street. Directly across from the two homes on the west side of S Florez Street and on the east side (current location of the vacant lot and two relatively new residential structures) the area is disturbed, possibly related to grading and/or waste disposal. Background information indicates the site was graded in 1995. Several dirt roads are visible around the site and within the project area. Areas of what appear to be surficial wastes are visible at the south, southeastern and eastern portion of the WDS.

2005, 2006, 2009, 2010, 2012, 2014 and 2016 Aerial Photographs – The 2005 through 2016 aerial photographs indicate the site generally similar to current conditions. Changes in the area are generally related to residential development to the north, the southernmost portion appearing to be the location of waste disposal based on the aerial photograph review and results of the March 2017 Phase II ESA. By 2005, the WDS area shows increased vegetation. Some areas of what appear to be surficial wastes are visible on the slopes of the waste disposal area. To the adjacent north and on the west side of S Florez Street are recently constructed residential properties. By 2005, a lumber company is located west of the site. Results of the Phase II ESA (Trench T-16) suggest wastes extend offsite to the west. However, historical aerial photographs did not clearly indicate wastes extending into this area. By 2009, an additional residence has been constructed on the west side of S Florez Street, adjacent to the site and the paved road has been extended south and a residence is being constructed on the west side of S Fernando Street at the terminus of the street. The residential lots on the east side of the terminus of S Florez Street remain undeveloped; however by 2012, the northern area appears to be graded. The 2016 aerial photograph indicates two recently constructed residential properties on the east side of S Florez Street, near the terminus. Stockpiles of debris that due to their locations appear to be related to the recent residential constructions are located to the east and south. During the site reconnaissance in 2016, the stockpiles appeared to consist of construction related debris such as bricks, concrete slabs, and cinder blocks and during the March 2017 Phase II ESA, the person knowledgeable about the property indicated that the stockpiled material was generated from excavating footing for the residential structure.

There also appears to be dumping to the southwest of the WDS as indicated in the 2005 to 2016 aerial photographs (on property that also appears to be owned by the Griffin Family Trust). The southwestern dump area appears to extend from the southern boundary of the Guyaux WDS to this dumping area. Surface disturbance is observed in the 1995 aerial photograph at the dumping; location southwest of the Guyaux WDS. However, by 2005 (to present) the aerial photographs indicate what appears to be dumping in this area possibly related to the Guyaux WDS.

6 SUMMARY

Based on background information, including results of compiling and reviewing the historical aerial photographs, topographic maps, the results of the Phase II ESA, and background information provided by others in the Phase II ESA report (Ninyo & Moore, 2017), it appears that several houses at the southernmost extent and on both the west and east sides of S Florez Street are likely underlain by wastes. It appears likely that three, and possibly up to five residences on the west side of S Florez Street are underlain by wastes. On the east side of S. Florez Street, it

appears that the vacant lot, the two residences under construction, and likely at least one additional residence to the north (based on results of the Phase II ESA, exploratory trenches T-3 and T-13) are possibly underlain by wastes. Based on a March 2017 conversation with a representative of the two properties under construction, the construction debris stockpile located to the adjacent east was generated during excavation of footings down to 4 feet bgs, indicating wastes extend to these properties. In addition, a nearby resident indicated that debris extended at least to the location of the water pump station approximately two houses north of the Project boundary, on the east side of S Florez Street (Figure 2). At least one residence and possibly more are likely underlain by wastes at the southern extent of S Fernando Street.

Based on the County of San Bernardino, GIS parcel data (Appendix A), the property to the west-northwest of the City of Colton property is indicated as owned by the Griffin Family Trust as well as the parcel to the south, and a small triangular shaped parcel (Figure 2). A portion of the property to the adjacent west-northwest appears to be the location of surface disturbance that may be related to waste disposal as early as 1953. The 1968 aerial photograph indicates a portion of the property to the adjacent west-northwest at the area of possible waste disposal as the location of an unpaved road that originates from here and continues south and terminates near the Santa Ana River/Channel at a location that appears to be used for dumping. This suggests that waste disposal at the Guyaux WDS was not only from S Florez Street, but also from a property to the adjacent west-northwest. Although not entirely clear, it appears that the wastes observed at exploratory trench T-16 that likely extend westerly (outlying the City of Colton property boundary), may be related to dumping originating from the property to the adjacent west-northwest as shown in the 1968 aerial photograph.

There also appears to be dumping to the southwest of the WDS as indicated in the 2005 to 2016 aerial photographs (on property that also appears to be owned by the Griffin Family Trust). The southwestern dump area, immediately east of the railroad tracks appears to extend from the southern boundary of the Guyaux WDS to this dumping area. Surface disturbance is observed in the 1995 aerial photograph at the location southwest of the Guyaux WDS. However, by 2005 (to present) the aerial photographs indicate what appears to be dumping in this area related to the Guyaux WDS.

In summary, there appear to be additional dumps related to the Griffin Wheel Company and the Guyaux WDS (e.g., adjacent west-northwest of the WDS on property that appears to be owned by the Griffin Family Trust and southwest of the Guyaux WDS to the adjacent east of the railroad tracks). In addition, the Griffin Wheel Dump, Chevron and Colton Landfill indicated as addressed 1280 Jefferson Street/Lane to the west of the railroad tracks may also be the location of previous waste disposal based on background information (this location was not evaluated as part of this review) (Figure 2).

There also appears to be other locations of dumping in the area as evidenced by roads, surface disturbances and what appears to be surface debris at some locations.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

PERFORMANCE PIPE (Continued) **1001967568**

TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
